JOURNAL Submitted (21-NOV-2002) Balzerque S., UMRGV, INRA/CNRS, 2 rue
Gaston Cremieux, 91057 Evry cedex, FRANCE
COMMENT PCR was performed on DNA from transformants of Arabidopsis thaliana
plants from INRA (Versailles). The DNA fragment(s) resulting from
the PCR were directly sequenced from the left or the right border
to determine the genomic sequence flanking the insertion. T-DNA
derived sequences were removed. Information to order the
corresponding mutant line and a link to a database providing a
graphical display of the insertion site are available at
http://dbsgap.versailles.inra.fr/publiclines/. This sequence has
been generated in the framework of the French plant genomics
program 'Genoplante' (http://www.genoplante.com and
http://genoplante-info.infobiogen.fr).

Title: US-10-633-163-47

Perfect score: 4267

Sequence: 1 ggtatctgtgcagcagg.....tgcagggtgattaaaaaa 4267

Scoring table: IDENTITY NUC

Gapop 10.0 , Gapext 0.5

Searched: 790 seqs, 13783 residues

Total number of hits satisfying chosen parameters: 1580

Minimum DB seq length: 8

Maximum DB seq length: 50

Post-processing: Minimum Match 0%

Maximum Match 100%

Listing first 832 summaries

Database : fetchrge47.seq.\*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

#### SUMMARIES

| Result No. | Score | Query Match % | Length | ID | Description        |

XX

XX Partitioning endogenous mRNA-protein complexes in vivo, by contacting

PT sample comprising the complex with ligand that binds to a component of

PT the complex and separating complex by binding ligand with a binding

PT molecule.

XX

XX Example 6; Page 31; 49pp; English.

XX

XX The specification describes a method for partitioning endogenous cellular

CC mRNA-protein (mRNP) complexes. The method comprises contacting a

CC biological sample comprising mRNP complex with ligand that specifically

CC binds a component of mRNP complex, separating mRNP complex by binding the

CC ligand with a molecule specific for ligand, which is attached to the

CC solid support and then collecting the mRNP complex by removing the

CC support from the support. The method is useful for in vivo partitioning

CC of cellular mRNA protein complexes in a biological sample. The method is

CC useful for determining the ribonomic profile of a cell which has numerous

CC

CC uses including monitoring of tumour development, state of growth or state

CC of development, perturbations of a biological system such as disease,

CC drug or toxin treatment and the state of cell aging or death,

CC distinguishing ribonomic profiles among organisms, to discriminate

CC between transcriptional and post-transcriptional contributions to gene

CC expression and to track the movement of RNAs through RNP complexes, RNP

CC including the interactions of combinations of proteins with RNAs in RNP

CC complexes. AAH28281-AAH28316 represent sequences derived from the 3'

CC untranslated region (UTR) of mRNA of various genes. The sequences contain

CC target sequences for RNA-binding proteins

XX

XX Assessing the metabolic state of a cell comprises isolating at least one

PT mRNP complex comprising at least one RNA binding protein, and at least

PT one mRNA or at least one mRNP complex-associated protein.

XX

XX Example 4; SEQ ID NO 29; 86pp; English.

XX

XX The present invention describes a method for assessing the metabolic

CC state of a cell. The method comprises isolating at least one mRNP complex

CC having at least one RNA binding protein, and at least one mRNA or at

CC least one mRNP complex-associated protein, and determining the expression

CC level of the mRNA or mRNP complex-associated protein, where the level of

CC expression of the at least one mRNA or the at least one mRNP complex-

CC associated protein is indicative of the metabolic state of the cell. The

CC method can be used for assessing the metabolic state in a cell, and for

CC identifying and evaluating mRNA and protein targets associated with mRNP

CC complexes and implicated in the expression of proteins involved in common

CC physiological pathways. The present sequence represents a TGF beta 2 3'-

CC UTR consensus sequence, which is used in an example from the present

CC invention.

CC solid support and then collecting the mrnp complex by removing the
CC complex from the support. The method is useful for in vivo partitioning
CC of cellular mRNA protein complexes in a biological sample. The method is
CC useful for determining the ribonomic profile of a cell which has numerous
CC uses including monitoring of tumour development, state of growth or state
CC of development, perturbations of a biological system such as disease,
CC drug or toxin treatment and the state of cell aging or death,
CC distinguishing ribonomic profiles among organisms, to discriminate
CC between transcriptional and post-transcriptional contributions to gene
CC expression and to track the movement of RNAs through RNP complexes,
CC including the interactions of combinations of proteins with RNAs in RNP
CC complexes. AAH28281-AAH28316 represent sequences derived from the 3'
CC untranslated region (UTR) of mRNA of various genes. The sequences contain
CC target sequences for RNA-binding proteins

 XX New compounds, particularly antisense oligonucleotides targeted to a  
 PT nucleic acid encoding TGF-beta 2, useful for treating cancer, a  
 PT neurodegenerative disorder, or a disease involving hyperactivation of  
 PT immune response.  
 XX  
 XX Example 13; SEQ ID NO 14; 135pp; English.  
 PS  
 XX The invention relates to a novel antisense compound of 8-80 nucleobases  
 CC in length targeted to, and which specifically hybridizes with, a nucleic  
 CC acid molecule encoding transforming growth factor (TGF)-beta 2, and  
 CC inhibits the expression of TGF-beta 2. The invention further relates to:  
 CC a compound 8-80 nucleobases in length that specifically hybridizes with  
 CC at least an 8-nucleobase portion of an active site on a nucleic acid  
 CC molecule encoding TGF-beta 2; a composition comprising the compound and a  
 CC carrier or diluent; inhibiting the expression of TGF-beta 2 in cells or  
 CC tissues by contacting the cells or tissues with the compound so that  
 CC expression of TGF-beta 2 is inhibited; treating an animal having a  
 CC disease or condition associated with TGF-beta 2 by administering to the  
 CC animal a therapeutic or prophylactic amount of the compound so that  
 CC expression of TGF-beta 2 is inhibited; and screening an antisense  
 CC compound. The antisense compound has cytostatic, neurotropic,  
 CC neuroprotective, and immunosuppressive activities. The compound,  
 CC composition and methods are useful for treating a disease or condition  
 CC associated with TGF-beta 2, such as a hyperproliferative disorder e.g.  
 CC cancer, a neurodegenerative disorder, or a disease or condition involving  
 CC hyperactivation of an immune response. This polynucleotide sequence  
 CC represents a probe used in the exemplification of the invention.

 XX Testing for bronchial asthma or chronic obstructive pulmonary disease by  
 PT comparing the expression level of a marker gene in a biological sample  
 PT

PT from a subject with the expression level of the gene in a sample from a  
PT healthy subject.  
XX  
PS Example 11; SEQ ID NO 1975; 241pp; English.  
XX  
CC The present invention describes a method of testing for bronchial asthma  
CC or chronic obstructive pulmonary disease. The method comprises  
CC determining the expression level of a marker gene in a biological sample  
CC from a subject, comparing the expression level determined with the  
CC expression level of the marker gene in a biological sample from a healthy  
CC subject, and judging whether the subject has bronchial asthma or chronic  
CC obstructive pulmonary disease. The marker gene comprises: (a) a group of  
CC genes (S1) whose expression levels increase when respiratory epithelial  
CC cells are stimulated with interleukin-13; or (b) a group of genes (S2)  
CC whose expression levels decrease when respiratory epithelial cells are  
CC stimulated with interleukin-13. Also described: (1) a reagent (I) for  
CC testing for bronchial asthma or chronic obstructive pulmonary disease;  
CC (2) a kit for screening for a candidate compound for a therapeutic agent  
CC to treat bronchial asthma or chronic obstructive pulmonary disease; (3)  
CC an animal model for bronchial asthma or chronic obstructive pulmonary  
CC disease; (4) an inducer that induces bronchial asthma in a mouse; (5) a  
CC method for producing an animal model for bronchial asthma or chronic  
CC obstructive pulmonary disease; (6) a therapeutic agent for bronchial  
CC asthma or chronic obstructive pulmonary disease, comprising the compound,  
CC a marker gene or an antisense nucleic acid corresponding to a portion of  
CC the marker gene, a ribozyme, a polynucleotide that suppresses the  
CC expression of the gene through an RNAi effect or an antibody recognising  
CC a protein encoded by a marker gene; and (7) a DNA chip for testing for  
CC bronchial asthma or a chronic obstructive pulmonary disease, on which a  
CC probe has been immobilised to assay a marker gene. (I) has respiratory  
CC and antiasthmatic activities, and can be used in gene therapy. The method  
CC is useful for testing for or screening for a therapeutic agent for  
CC bronchial asthma or chronic obstructive pulmonary disease. The present  
CC sequence is used in the exemplification of the present invention.

 XX Androgen independent, aggressively tumorigenic prostate cancer cell lines  
 PT designated CL-1 and CL-2, useful as tools for studying the cellular and  
 PT molecular mechanisms of prostate cancer progression.  
 XX  
 PS Example 2; Page 30; 90pp; English.  
 CC The present invention relates to androgen independent, aggressively  
 CC tumorigenic prostate cancer cell lines, CL-1 and CL-2, which are  
 CC sublines of the LNCaP cell line. The present sequence is a PCR primer  
 CC used to amplify a coding sequence expressed by the cell lines. The coding  
 CC sequences which were amplified in the present invention by the primers in  
 CC AAA76068 to AAA76107 were: beta-actin, prostate-specific antigen (PSA),  
 CC Androgen receptor (AR), Prostate specific membrane antigen (PSAM),  
 CC Interleukin-8 (IL-8), Vascular endothelial cell growth factor (VEGF),  
 CC Basic fibroblast growth factor (bFGF), Interleukin-6 (IL-6), Transforming  
 CC Growth Factor-beta1 (TGF-beta1), Transforming Growth Factor-beta2 (TGF-  
 CC beta2), Transforming Growth Factor-beta-R (TGF-beta-R), Epidermal growth

CC factor receptor (EGF-R), BCL-2, E-cadherin, p53, PTEN, Caveolin, c-myc,  
 CC HER-2/neu and p27. RT-PCR was used to monitor changes in coding sequence  
 CC expression, as the LNCaP parental lines progressed to the CL1 and CL2  
 CC sublines. The CL-1 and CL-2 sublines can be used as tools for studying  
 CC the cellular and molecular mechanisms of prostate cancer progression.  
 CC such as the expression patterns of various transcripts and proteins that  
 CC are associated with the progression of the non-metastatic, androgen-  
 CC dependent state to the metastatic androgen-independent state

 XX New polynucleotide, useful for treating prostatic cancer, comprises  
 PT prostate specific chimeric enhancer and proximal promoter sequence  
 PT operably linked to nucleic acid encoding heterologous polypeptide.  
 XX  
 PS Example 5; Page 73; 131pp; English.  
 XX  
 CC The present sequence was used in reverse transcriptase polymerase chain  
 CC reaction (RT-PCR) analysis of human prostate cancer cells. The invention  
 CC relates to an isolated polynucleotide comprising a prostate-specific  
 CC chimeric enhancer (PSE) sequence and a proximal promoter sequence  
 CC operably linked to a nucleic acid segment that encodes a heterologous  
 CC polypeptide. The PSE contains an ARE and specifically activates  
 CC transcription of the nucleic acid segment in a mammalian prostate cell.  
 CC The construct is useful for the treatment of a prostate disorder or a  
 CC metastasised prostate cancer, such as hyperplasia or hyperproliferation  
 CC of prostate cells. It is also useful for directing the tissue-specific  
 CC expression of a heterologous polypeptide in a human prostate cell. The  
 CC construct may be administered by injection, infection, transfection, or  
 CC liposome-mediated transfection, polybrene-mediated transfection, receptor  
 CC -mediated uptake or Ca-PO4-mediated transfection

PT Partitioning endogenous mRNA-protein complexes in vivo, by contacting
PT sample comprising the complex with ligand that binds to a component of
PT the complex and separating complex by binding ligand with a binding
PT molecule.
XX
PS Example 6; Page 31; 49pp; English.
XX
CC The specification describes a method for partitioning endogenous cellular
CC mRNA-protein (mRNP) complexes. The method comprises contacting a
CC biological sample comprising mRNP complex with ligand that specifically
CC binds a component of mRNP complex, separating mRNP complex by binding the
CC ligand with a molecule specific for ligand, which is attached to the
CC solid support and then collecting the mRNP complex by removing the
CC complex from the support. The method is useful for in vivo partitioning
CC of cellular mRNA protein complexes in a biological sample. The method is
CC useful for determining the ribonomic profile of a cell which has numerous
CC uses including monitoring of tumour development, state of growth or state
CC of development, perturbations of a biological system such as disease,
CC drug or toxin treatment and the state of cell aging or death,
CC distinguishing ribonomic profiles among organisms, to discriminate
CC between transcriptional and post-transcriptional contributions to gene
CC expression and to track the movement of RNAs through RNP complexes,
CC including the interactions of combinations of proteins with RNAs in RNP
CC complexes. AAH2831-AAH28316 represent sequences derived from the 3'
CC untranslated region (UTR) of mRNA of various genes. The sequences contain
CC target sequences for RNA-binding proteins

DR Testing for bronchial asthma or chronic obstructive pulmonary disease by
XX comparing the expression level of a marker gene in a biological sample
XX from a subject with the expression level of the gene in a sample from a
XX healthy subject.
XX
PS Example 11; SEQ ID NO 1874; 241pp; English.
XX
CC The present invention describes a method of testing for bronchial asthma
CC or chronic obstructive pulmonary disease. The method comprises
CC determining the expression level of a marker gene in a biological sample
CC from a subject, comparing the expression level determined with the
CC expression level of the marker gene in a biological sample from a healthy
CC subject, and judging whether the subject has bronchial asthma or chronic
CC obstructive pulmonary disease. The marker gene comprises: (a) a group of
CC genes (S1) whose expression levels increase when respiratory epithelial
CC cells are stimulated with interleukin-13; or (b) a group of genes (S2)
CC whose expression levels decrease when respiratory epithelial cells are
CC stimulated with interleukin-13. Also described: (1) a reagent (I) for
CC testing for bronchial asthma or chronic obstructive pulmonary disease;
CC (2) a kit for screening for a candidate compound for a therapeutic agent
CC to treat bronchial asthma or chronic obstructive pulmonary disease; (3)
CC an animal model for bronchial asthma or chronic obstructive pulmonary
CC disease; (4) an inducer that induces bronchial asthma in a mouse; (5) a
CC method for producing an animal model for bronchial asthma or chronic
CC obstructive pulmonary disease; (6) a therapeutic agent for bronchial
CC asthma or chronic obstructive pulmonary disease, comprising the compound,
CC a marker gene or an antisense nucleic acid corresponding to a portion of
CC the marker gene, a ribozyme, a polynucleotide that suppresses the
CC expression of the gene through an RNAi effect or an antibody recognising
CC a protein encoded by a marker gene; and (7) a DNA chip for testing for
CC bronchial asthma or a chronic obstructive pulmonary disease, on which a
CC probe has been immobilised to assay a marker gene. (I) has respiratory
CC and antiasthmatic activities, and can be used in gene therapy. The method
CC is useful for testing for or screening for a therapeutic agent for
CC bronchial asthma or chronic obstructive pulmonary disease. The present
CC sequence is used in the exemplification of the present invention.

XX  
XX The invention relates to human ATP-dependent serine protein hydrolase 12  
CC (ABB9561) and nucleic acids encoding it (ABL41486). The protein has a  
CC molecular weight of 12 kD. The invention also relates to a method for the  
CC recombinant production of the protein, an antagonist of the protein, and  
CC the use of the protein, gene and antagonist in therapeutic applications.  
CC ATP-dependent serine protein hydrolase 12 can be used in the treatment of  
CC a variety of diseases such as cancer and HIV (human immunodeficiency  
CC virus) infection. Sequences ABL41487-ABL41488 represent reverse  
CC transcription-PCR (RT-PCR) primers used in an exemplification of the  
CC invention to isolate human ATP-dependent serine protein hydrolase 12 cDNA

XX  
XX The present invention provides a method for identifying a set of  
CC extendible primers which can be used in the identification, typing and  
CC classification of genes. This can then be used to predict protein  
CC sequence and structure, in organ donation to match the organ with the  
CC receiver, and to identify bacteria in a sample. The method can be used to  
CC type the human leukocyte antigen genes (HLA) and 16s rRNA genes in  
CC particular

XX Monitoring/detecting small molecule-biomolecule interactions for drug  
PT screening involves contacting a solution of small molecules with  
PT immobilized biomolecules and measuring the frequency generated with an  
PT acoustic wave device.  
PT  
XX  
XX Example 4; Fig 5; 44pp; English.  
PS  
XX  
XX The present invention describes a device and method for monitoring small  
CC molecule-biomolecule interactions. These involve the measurement of the  
CC oscillation of a liquid when in contact with the biomolecule only  
CC compared with the small molecule-biomolecule complex. This uses a  
CC piezoelectric device and can be used with biomolecules such as DNA. The  
CC present sequence was used as an example. The device can be used to screen

CC for drug candidates, to determine the conditions in which small molecules  
CC will not bind to given biomolecules and to obtain information on the  
CC tertiary structure of biomolecules

Regulation of trophoblast invasion - by, e.g. transforming growth factor-beta3 inhibitor, useful for detecting or treating preeclampsia in pregnant women.

XX  
PS  
Example 4: Page 21: 59pp: English.

PCR primers AAV63217-18 were used to amplify cDNA encoding human transforming growth factor-beta 2 (TGF-beta2). The specification describes a composition for regulating trophoblast invasion which comprises an inhibitor of TGF-beta3, TGF-beta family cytokine receptors, hypoxia inducible factor 1 alpha (HIF-1 alpha) or oxygen tension. The composition is used in methods of diagnosing, monitoring, preventing or treating conditions requiring regulation of trophoblast invasion, especially preeclampsia in pregnant women or choriocarcinomas

The invention provides a transgenic animal devoid of osteogenic property.  
 The transgenic animal has an introduced variation in a gene encoding for  
 core binding factor/polyoma enhancer binding protein (CBF1/PEBP2-alpha-  
 A), particularly in runt region DNA, especially prepared by introduction  
 of a variation devoid of at least a part of gene encoding CBF1/PEBP2-  
 alpha-A, leading to a disturbance in differentiation and maturation of  
 osteoblast cells. The transgenic animal can be prepared by introducing a  
 variant gene encoding for CBF1/PEBP2-alpha-A. The animal can be used to  
 elucidate the in vivo mechanism of CBF1/PEBP2-alpha-A. Sequences  
 AAU79975 to AAV80010 represent PCR primers used during the course of the  
 invention

PT neurodegenerative disorder, or a disease involving hyperactivation of  
PT immune response.  
XX  
PS Example 16; SEQ ID NO 232; 135pp; English.  
XX  
CC The invention relates to a novel antisense compound of 8-80 nucleobases  
CC in length targeted to, and which specifically hybridizes with, a nucleic  
CC acid molecule encoding transforming growth factor (TGF)-beta 2, and  
CC inhibits the expression of TGF-beta 2. The invention further relates to:  
CC a compound 8-80 nucleobases in length that specifically hybridizes with  
CC at least an 8-nucleobase portion of an active site on a nucleic acid  
CC molecule encoding TGF-beta 2; a composition comprising the compound and a  
CC carrier or diluent; inhibiting the expression of TGF-beta 2 in cells or  
CC tissues by contacting the cells or tissues with the compound so that  
CC expression of TGF-beta 2 is inhibited; treating an animal having a  
CC disease or condition associated with TGF-beta 2 by administering to the  
CC animal a therapeutic or prophylactic amount of the compound so that  
CC expression of TGF-beta 2 is inhibited; and screening an antisense  
CC compound. The antisense compound has cytostatic, neurotropic,  
CC neuroprotective, and immunosuppressive activities. The compound,  
CC composition and methods are useful for treating a disease or condition  
CC associated with TGF-beta 2, such as a hyperproliferative disorder e.g.  
CC cancer, a neurodegenerative disorder, or a disease or condition involving  
CC hyperactivation of an immune response. This polynucleotide sequence  
CC represents an antisense oligonucleotide of the invention.  
XX

 PS Example 16; SEQ ID NO 269; 135pp; English.  
 XX  
 CC The invention relates to a novel antisense compound of 8-80 nucleobases  
 CC in length targeted to, and which specifically hybridizes with, a nucleic  
 CC acid molecule encoding transforming growth factor (TGF)-beta 2, and  
 CC inhibits the expression of TGF-beta 2. The invention further relates to:  
 CC a compound 8-80 nucleobases in length that specifically hybridizes with  
 CC at least an 8-nucleobase portion of an active site on a nucleic acid  
 CC molecule encoding TGF-beta 2; a composition comprising the compound and a  
 CC carrier or diluent; inhibiting the expression of TGF-beta 2 in cells or  
 CC tissues by contacting the cells or tissues with the compound so that  
 CC expression of TGF-beta 2 is inhibited; treating an animal having a  
 CC disease or condition associated with TGF-beta 2 by administering to the  
 CC animal a therapeutic or prophylactic amount of the compound so that  
 CC expression of TGF-beta 2 is inhibited; and screening an antisense  
 CC compound. The antisense compound has cytostatic, nontropic,  
 CC neuroprotective, and immunosuppressive activities. The compound,  
 CC composition and methods are useful for treating a disease or condition  
 CC associated with TGF-beta 2, such as a hyperproliferative disorder e.g.  
 CC cancer, a neurodegenerative disorder, or a disease or condition involving  
 CC hyperactivation of an immune response. This polynucleotide sequence  
 CC represents a preferred target DNA region of TGF-beta 2 of the invention.

 XX The invention relates to a novel antisense compound of 8-80 nucleobases  
 XX in length targeted to, and which specifically hybridizes with, a nucleic  
 XX acid molecule encoding transforming growth factor (TGF)-beta 2, and  
 XX inhibits the expression of TGF-beta 2. The invention further relates to:  
 XX a compound 8-80 nucleobases in length that specifically hybridizes with  
 XX at least an 8-nucleobase portion of an active site on a nucleic acid  
 XX molecule encoding TGF-beta 2; a composition comprising the compound and a  
 XX carrier or diluent; inhibiting the expression of TGF-beta 2 in cells or  
 XX tissues by contacting the cells or tissues with the compound so that  
 XX expression of TGF-beta 2 is inhibited; treating an animal having a  
 XX disease or condition associated with TGF-beta 2 by administering to the  
 XX animal a therapeutic or prophylactic amount of the compound so that  
 XX expression of TGF-beta 2 is inhibited; and screening an antisense  
 XX compound. The antisense compound has cytostatic, neurotropic,  
 XX neuroprotective, and immunosuppressive activities. The compound,  
 XX composition and methods are useful for treating a disease or condition  
 XX associated with TGF-beta 2, such as a hyperproliferative disorder e.g.  
 XX cancer, a neurodegenerative disorder, or a disease or condition involving  
 XX hyperactivation of an immune response. This polynucleotide sequence  
 XX represents a preferred target DNA region of TGF-beta 2 of the invention.

 CC The invention relates to a novel antisense compound of 8-80 nucleobases  
 CC in length targeted to, and which specifically hybridizes with, a nucleic  
 CC acid molecule encoding transforming growth factor (TGF)-beta 2, and  
 CC inhibits the expression of TGF-beta 2. The invention further relates to:  
 CC a compound 8-80 nucleobases in length that specifically hybridizes with  
 CC at least an 8-nucleobase portion of an active site on a nucleic acid  
 CC molecule encoding TGF-beta 2; a composition comprising the compound and a  
 CC carrier or diluent; inhibiting the expression of TGF-beta 2 in cells or  
 CC tissues by contacting the cells or tissues with the compound so that  
 CC expression of TGF-beta 2 is inhibited; treating an animal having a  
 CC disease or condition associated with TGF-beta 2 by administering to the  
 CC animal a therapeutic or prophylactic amount of the compound so that  
 CC expression of TGF-beta 2 is inhibited; and screening an antisense  
 CC compound. The antisense compound has cytostatic, neurotropic,  
 CC neuroprotective, and immunosuppressive activities. The compound,  
 CC composition and methods are useful for treating a disease or condition  
 CC associated with TGF-beta 2, such as a hyperproliferative disorder e.g.  
 CC cancer, a neurodegenerative disorder, or a disease or condition involving  
 CC hyperactivation of an immune response. This polynucleotide sequence  
 CC represents an antisense oligonucleotide of the invention.

CC acid molecule encoding transforming growth factor (TGF)-beta 2, and  
CC inhibits the expression of TGF-beta 2. The invention further relates to:  
CC a compound 8-80 nucleobases in length that specifically hybridizes with  
CC at least an 8-nucleobase portion of an active site on a nucleic acid  
CC molecule encoding TGF-beta 2; a composition comprising the compound and a  
CC carrier or diluent; inhibiting the expression of TGF-beta 2 in cells or  
CC tissues by contacting the cells or tissues with the compound so that  
CC expression of TGF-beta 2 is inhibited; treating an animal having a  
CC disease or condition associated with TGF-beta 2 by administering to the  
CC animal a therapeutic or prophylactic amount of the compound so that  
CC expression of TGF-beta 2 is inhibited; and screening an antisense  
CC compound. The antisense compound has cytostatic, neurotropic,  
CC neuroprotective, and immunosuppressive activities. The compound,  
CC composition and methods are useful for treating a disease or condition  
CC associated with TGF-beta 2, such as a hyperproliferative disorder e.g.  
CC cancer, a neurodegenerative disorder, or a disease or condition involving  
CC hyperactivation of an immune response. This polynucleotide sequence  
CC represents an antisense oligonucleotide of the invention.

 CC a compound 8-80 nucleobases in length that specifically hybridizes with  
 CC at least an 8-nucleobase portion of an active site on a nucleic acid  
 CC molecule encoding TGF-beta 2; a composition comprising the compound and a  
 CC carrier or diluent; inhibiting the expression of TGF-beta 2 in cells or  
 CC tissues by contacting the cells or tissues with the compound so that  
 CC expression of TGF-beta 2 is inhibited; treating an animal having a  
 CC disease or condition associated with TGF-beta 2 by administering to the  
 CC animal a therapeutic or prophylactic amount of the compound so that  
 CC expression of TGF-beta 2 is inhibited; and screening an antisense  
 CC compound. The antisense compound has cytostatic, neurotropic,  
 CC neuroprotective, and immunosuppressive activities. The compound,  
 CC composition and methods are useful for treating a disease or condition  
 CC associated with TGF-beta 2, such as a hyperproliferative disorder e.g.  
 CC cancer, a neurodegenerative disorder, or a disease or condition involving  
 CC hyperactivation of an immune response. This polynucleotide sequence  
 CC represents an antisense oligonucleotide of the invention.

XX New compounds, particularly antisense oligonucleotides targeted to a
XX PT nucleic acid encoding TGF-beta 2, useful for treating cancer, a
XX PT neurodegenerative disorder, or a disease involving hyperactivation of
XX PT immune response.
XX PS
XX Example 16; SEQ ID NO 119; 135pp; English.
XX CC
XX The invention relates to a novel antisense compound of 8-80 nucleobases
XX CC in length targeted to, and which specifically hybridizes with, a nucleic
XX CC acid molecule encoding transforming growth factor (TGF)-beta 2, and
XX CC inhibits the expression of TGF-beta 2. The invention further relates to:
XX CC at least an 8-nucleobase portion of an active site on a nucleic acid
XX CC molecule encoding TGF-beta 2; a composition comprising the compound and a
XX CC carrier or diluent; inhibiting the expression of TGF-beta 2 in cells or
XX CC tissues by contacting the cells or tissues with the compound so that
XX CC expression of TGF-beta 2 is inhibited; treating an animal having a
XX CC disease or condition associated with TGF-beta 2 by administering to the
XX CC animal a therapeutic or prophylactic amount of the compound so that
XX CC expression of TGF-beta 2 is inhibited; and screening an antisense
XX CC compound. The antisense compound has cytostatic, neurotropic,
XX CC neuroprotective, and immunosuppressive activities. The compound,
XX CC composition and methods are useful for treating a disease or condition
XX CC associated with TGF-beta 2, such as a hyperproliferative disorder e.g.
XX CC cancer, a neurodegenerative disorder, or a disease or condition involving
XX CC hyperactivation of an immune response. This polynucleotide sequence
XX CC represents an antisense oligonucleotide of the invention.

 XX The invention relates to a novel antisense compound of 8-80 nucleobases  
 XX in length targeted to, and which specifically hybridizes with, a nucleic  
 XX acid molecule encoding transforming growth factor (TGF)-beta 2, and  
 XX inhibits the expression of TGF-beta 2. The invention further relates to:  
 CC a compound 8-80 nucleobases in length that specifically hybridizes with  
 CC at least an 8-nucleobase portion of an active site on a nucleic acid  
 CC molecule encoding TGF-beta 2; a composition comprising the compound and a  
 CC carrier or diluent; inhibiting the expression of TGF-beta 2 in cells or  
 CC tissues by contacting the cells or tissues with the compound so that  
 CC expression of TGF-beta 2 is inhibited; treating an animal having a  
 CC disease or condition associated with TGF-beta 2 by administering to the  
 CC animal a therapeutic or prophylactic amount of the compound so that  
 CC expression of TGF-beta 2 is inhibited; and screening an antisense  
 CC compound. The antisense compound has cytostatic, neurotropic,  
 CC neuroprotective, and immunosuppressive activities. The compound,  
 CC composition and methods are useful for treating a disease or condition

XX New compounds, particularly antisense oligonucleotides targeted to a

PT nucleic acid encoding TGF-beta 2, useful for treating cancer, a

PT neurodegenerative disorder, or a disease involving hyperactivation of

PT immune response.

XX Example 16; SEQ ID NO 161; 135pp; English.

XX The invention relates to a novel antisense compound of 8-80 nucleobases

CC in length targeted to, and which specifically hybridizes with, a nucleic

CC acid molecule encoding transforming growth factor (TGF)-beta 2, and

CC inhibits the expression of TGF-beta 2. The invention further relates to:

CC a compound 8-80 nucleobases in length that specifically hybridizes with

CC at least an 8-nucleobase portion of an active site on a nucleic acid

CC molecule encoding TGF-beta 2; a composition comprising the compound and a

CC carrier or diluent; inhibiting the expression of TGF-beta 2 in cells or

CC tissues by contacting the cells or tissues with the compound so that

CC disease or condition associated with TGF-beta 2 by administering to the

CC animal a therapeutic or prophylactic amount of the compound so that

CC expression of TGF-beta 2 is inhibited; treating an animal having a

CC disease or condition associated with TGF-beta 2 by administering to the

CC animal a therapeutic or prophylactic amount of the compound so that

CC expression of TGF-beta 2 is inhibited; and screening an antisense

CC compound. The antisense compound has cytostatic, neurotropic,

CC neuroprotective, and immunosuppressive activities. The compound,

CC composition and methods are useful for treating a disease or condition

CC associated with TGF-beta 2, such as a hyperproliferative disorder e.g.

CC cancer, a neurodegenerative disorder, or a disease or condition involving

CC hyperactivation of an immune response. This polynucleotide sequence

CC represents an antisense oligonucleotide of the invention.

PT New compounds, particularly antisense oligonucleotides targeted to a

PT nucleic acid encoding TGF-beta 2, useful for treating cancer, a

PT neurodegenerative disorder, or a disease involving hyperactivation of

PT immune response.

XX Example 16; SEQ ID NO 233; 135pp; English.

XX The invention relates to a novel antisense compound of 8-80 nucleobases

CC in length targeted to, and which specifically hybridizes with, a nucleic

CC acid molecule encoding transforming growth factor (TGF)-beta 2, and

CC inhibits the expression of TGF-beta 2. The invention further relates to:

CC a compound 8-80 nucleobases in length that specifically hybridizes with

CC at least an 8-nucleobase portion of an active site on a nucleic acid

CC molecule encoding TGF-beta 2; a composition comprising the compound and a

CC carrier or diluent; inhibiting the expression of TGF-beta 2 in cells or

CC tissues by contacting the cells or tissues with the compound so that

CC expression of TGF-beta 2 is inhibited; treating an animal having a

CC disease or condition associated with TGF-beta 2 by administering to the

CC animal a therapeutic or prophylactic amount of the compound so that

CC expression of TGF-beta 2 is inhibited; and screening an antisense

CC compound. The antisense compound has cytostatic, neurotropic,

CC neuroprotective, and immunosuppressive activities. The compound,

CC composition and methods are useful for treating a disease or condition

CC associated with TGF-beta 2, such as a hyperproliferative disorder e.g.

CC cancer, a neurodegenerative disorder, or a disease or condition involving

CC hyperactivation of an immune response. This polynucleotide sequence

CC represents a preferred target DNA region of TGF-beta 2 of the invention.

CC The invention relates to a novel antisense compound of 8-80 nucleobases  
CC in length targeted to, and which specifically hybridizes with, a nucleic  
CC acid molecule encoding transforming growth factor (TGF)-beta 2, and  
CC inhibits the expression of TGF-beta 2. The invention further relates to:  
CC a compound 8-80 nucleobases in length that specifically hybridizes with  
CC at least an 8-nucleobase portion of an active site on a nucleic acid  
CC molecule encoding TGF-beta 2; a composition comprising the compound and a  
CC carrier or diluent; inhibiting the expression of TGF-beta 2 in cells or  
CC tissues by contacting the cells or tissues with the compound so that  
CC expression of TGF-beta 2 is inhibited; treating an animal having a  
CC disease or condition associated with TGF-beta 2 by administering to the  
CC animal a therapeutic or prophylactic amount of the compound so that  
CC expression of TGF-beta 2 is inhibited; and screening an antisense  
CC compound. The antisense compound has cytostatic, neurotropic,  
CC neuroprotective, and immunosuppressive activities. The compound,  
CC composition and methods are useful for treating a disease or condition  
CC associated with TGF-beta 2, such as a hyperproliferative disorder e.g.

CC cancer, a neurodegenerative disorder, or a disease or condition involving  
CC hyperactivation of an immune response. This polynucleotide sequence  
CC represents a preferred target DNA region of TGF-beta 2 of the invention.

 XX CC The invention relates to a novel antisense compound of 8-80 nucleobases  
 CC in length targeted to, and which specifically hybridizes with, a nucleic  
 CC acid molecule encoding transforming growth factor (TGF)-beta 2, and  
 CC inhibits the expression of TGF-beta 2. The invention further relates to:  
 CC a compound 8-80 nucleobases in length that specifically hybridizes with  
 CC at least an 8-nucleobase portion of an active site on a nucleic acid  
 CC molecule encoding TGF-beta 2; a composition comprising the compound and a  
 CC carrier or diluent; inhibiting the expression of TGF-beta 2 in cells or  
 CC tissues by contacting the cells or tissues with the compound so that  
 CC expression of TGF-beta 2 is inhibited; treating an animal having a  
 CC disease or condition associated with TGF-beta 2 by administering to the  
 CC animal a therapeutic or prophylactic amount of the compound so that  
 CC expression of TGF-beta 2 is inhibited; and screening an antisense  
 CC compound. The antisense compound has cytostatic, neurotropic,  
 CC neuroprotective, and immunosuppressive activities. The compound,  
 CC composition and methods are useful for treating a disease or condition  
 CC associated with TGF-beta 2, such as a hyperproliferative disorder e.g.  
 CC cancer, a neurodegenerative disorder, or a disease or condition involving  
 CC hyperactivation of an immune response. This polynucleotide sequence  
 CC represents a preferred target DNA region of TGF-beta 2 of the invention.

CC The invention relates to a novel antisense compound of 8-80 nucleobases in length targeted to, and which specifically hybridizes with, a nucleic acid molecule encoding transforming growth factor (TGF)-beta 2, and inhibits the expression of TGF-beta 2. The invention further relates to: a compound 8-80 nucleobases in length that specifically hybridizes with at least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding TGF-beta 2; a composition comprising the compound and a carrier or diluent; inhibiting the expression of TGF-beta 2 in cells or tissues by contacting the cells or tissues with the compound so that expression of TGF-beta 2 is inhibited; treating an animal having a disease or condition associated with TGF-beta 2 by administering to the animal a therapeutic or prophylactic amount of the compound so that expression of TGF-beta 2 is inhibited; and screening an antisense compound. The antisense compound has cytostatic, neurotropic, neuroprotective, and immunosuppressive activities. The compound, composition and methods are useful for treating a disease or condition associated with TGF-beta 2, such as a hyperproliferative disorder e.g. cancer, a neurodegenerative disorder, or a disease or condition involving hyperactivation of an immune response. This polynucleotide sequence represents an antisense oligonucleotide of the invention.

XX  
XX New compounds, particularly antisense oligonucleotides targeted to a  
PT nucleic acid encoding TGF-beta 2, useful for treating cancer, a  
PT neurodegenerative disorder, or a disease involving hyperactivation of  
PT immune response.  
XX  
XX Example 16; SEQ ID NO 267; 135pp; English.  
XX  
XX The invention relates to a novel antisense compound of 8-80 nucleobases  
CC in length targeted to, and which specifically hybridizes with, a nucleic  
CC acid molecule encoding transforming growth factor (TGF)-beta 2, and  
CC inhibits the expression of TGF-beta 2. The invention further relates to:  
CC a compound 8-80 nucleobases in length that specifically hybridizes with  
CC at least an 8-nucleobase portion of an active site on a nucleic acid  
CC molecule encoding TGF-beta 2; a composition comprising the compound and a  
CC carrier or diluent; inhibiting the expression of TGF-beta 2 in cells or  
CC tissues by contacting the cells or tissues with the compound so that  
CC expression of TGF-beta 2 is inhibited; treating an animal having a  
CC disease or condition associated with TGF-beta 2 by administering to the  
CC animal a therapeutic or prophylactic amount of the compound so that  
CC expression of TGF-beta 2 is inhibited; and screening an antisense  
CC compound. The antisense compound has cytostatic, nontropic,  
CC neuroprotective, and immunosuppressive activities. The compound,  
CC composition and methods are useful for treating a disease or condition  
CC associated with TGF-beta 2, such as a hyperproliferative disorder e.g.  
CC cancer, a neurodegenerative disorder, or a disease or condition involving  
CC hyperactivation of an immune response. This polynucleotide sequence  
CC represents a preferred target DNA region of TGF-beta 2 of the invention.

CC The invention relates to a novel antisense compound of 8-80 nucleobases  
CC in length targeted to, and which specifically hybridizes with, a nucleic  
CC acid molecule encoding transforming growth factor (TGF)-beta 2, and  
CC inhibits the expression of TGF-beta 2. The invention further relates to:  
CC a compound 8-80 nucleobases in length that specifically hybridizes with  
CC a compound 8-80 nucleobases in length that specifically hybridizes with  
CC at least an 8-nucleobase portion of an active site on a nucleic acid  
CC molecule encoding TGF-beta 2; a composition comprising the compound and a  
CC carrier or diluent; inhibiting the expression of TGF-beta 2 in cells or  
CC tissues by contacting the cells or tissues with the compound so that  
CC expression of TGF-beta 2 is inhibited; treating an animal having a  
CC disease or condition associated with TGF-beta 2 by administering to the  
CC animal a therapeutic or prophylactic amount of the compound so that  
CC expression of TGF-beta 2 is inhibited; and screening an antisense  
CC compound. The antisense compound has cytostatic, neurotropic,  
CC neuroprotective, and immunosuppressive activities. The compound,  
CC composition and methods are useful for treating a disease or condition  
CC associated with TGF-beta 2, such as a hyperproliferative disorder e.g.  
CC cancer, a neurodegenerative disorder, or a disease or condition involving  
CC hyperactivation of an immune response. This polynucleotide sequence  
CC represents a preferred target DNA region of TGF-beta 2 of the invention.

PT susceptibility to a cardiovascular disease, e.g. atherosclerosis,  
PT restenosis or stroke.  
XX  
XX Disclosure; Page 68; 187pp; English.  
PS  
XX The invention relates an isolated polynucleotide (I) encoded by a  
CC cardiovascular associated (CA) gene, having allelic variation contained  
CC in a functional surrounding like full length cDNA for CA gene  
CC polypeptide, and with or without the CA gene promoter sequence. (I) is a  
CC polynucleotide comprising single nucleotide polymorphisms predicting

CC cardiovascular disease. The polynucleotides are useful for assessing  
CC predisposition or susceptibility to a cardiovascular disease, e.g.  
CC atherosclerosis, ischemia/reperfusion, hypertension, restenosis, arterial  
CC inflammation, myocardial infarction, and stroke. These may also be used  
CC to predict personal medication schemes omitting adverse drug reactions,  
CC or as probes for detecting genetic polymorphisms and as templates for the  
CC recombinant production of normal or variant peptides/polypeptides encoded  
CC by the genes. This sequence corresponds to a PCR primer to amplify one of  
CC the genes of the invention.

XX Oligo:nucleotide N3'-P5' phosphoramidate(s) - have improved resistance  
PT toward phosphodiesterase digestion, and form stable duplexes with DNA and  
PT RNA strands.  
XX  
XX Disclosure; Page 61; 101pp; English.  
PS  
XX The specification describes oligodeoxyribonucleotides having contiguous  
CC nucleoside subunits joined by intersubunit linkages, where at least 3  
CC contiguous subunits are joined by phosphoramidate intersubunits. The  
CC oligodeoxyribonucleotides has a sequence of nucleoside subunits effective  
CC to form a duplex with a target nucleic acid molecule. The  
CC oligodeoxyribonucleotides are more resistant to nuclease digestion and  
CC have improved RNA and dsDNA hybridisation characteristics, relative to  
CC oligonucleotides not containing N3'-P5' phosphoramidate linkages. They  
CC also have excellent antisense activity against complementary mRNA targets  
CC in in-vitro cell growth inhibition assays. They also exhibit low  
CC cytotoxicity. They may be used in diagnostic and therapeutic  
CC applications, e.g., in combatting infections agents such as bacteria,  
CC viruses, etc. or in treatment of smooth muscle cell proliferation

This sequence represents a synthetic polyguanosine tract PCR primer #22, used with primer #21 (AAZ19841) to generate a vector to the substitute a polyguanosine tract for the plastid atpB gene 3' untranslated region (3' UTR). This vector was then used in the generation of transgenic plants which can inducibly express a trehalose biosynthetic enzyme in a plastid. Trehalose is a disaccharide (a-D-glucopyranosyl-[1,1]-a-D-glucopyranoside) commonly found in organisms such as bacteria, fungi and insects which acts as a protectant against the deleterious effects of various stresses such as heat, desiccation and the deleterious effects of biosynthesis requires two enzymic activities; a trehalose-6-phosphate synthase catalyses the condensation of UDP-glucose and glucose-6-phosphate to trehalose-6-phosphate; and a trehalase-6-phosphate phosphatase phosphorylates trehalose-6-phosphate to trehalose. Previous attempts have been made to express trehalase biosynthetic enzymes in plants; however, certain deleterious effects appear to be associated with constitutive trehalase production in the cytosol, particularly when expression occurs in root tissue or during early development. These adverse effects include stunted growth, abnormal leaves and undeveloped roots. The use of an inducible promoter prevents these effects. Transformation with constructs containing trehalase biosynthetic enzymes under the control of an inducible promoter can provide plants protected against drought, high salinity, osmotic stress and temperature extremes. They can also be used for increasing the storage properties of plants.

PT Novel plant useful for treating or preventing allergy, comprising a DNA  
PT molecule encoding a mature ragweed pollen allergen in its plasmid genome  
PT and capable of expressing the pollen allergen.  
XX  
PS Example 10; Page 47; 99pp; English.  
XX  
CC The invention relates to a transgenic plant comprising in its plasmid  
CC genome a DNA molecule encoding a mature ragweed pollen allergen, which is  
CC capable of expressing the pollen allergen. The plant or plant matter  
CC derived from the transgenic plant such as tobacco, tomato, soybean, rice  
CC or maize is useful for treating or preventing an allergy. The plant is  
CC also useful as a pharmaceutical and as a medical food. The plant is  
CC useful for suppressing and reducing undesired immune response, and  
CC production of an antigen for determination of immunological activity. The  
CC plant is useful for treating and preventing bacterial, parasitic and  
CC viral diseases, allergies, autoimmune diseases and transplantations. The  
CC present sequence is an oligonucleotide used for constructing pAT222  
CC vector using polyguanosine tract as a substitute for 3' UTR

XX New antisense oligonucleotides for modulating expression of genes
PT encoding fibroblast growth factor receptor 2, useful for treating
PT hyperproliferative (e.g. cancer of the colon, lung, breast or skin) or
PT developmental disorders.
XX Example 13; SEQ ID NO 13; 200pp; English.
XX The present invention relates to antisense oligonucleotides (ADH63077-
CC ADH63154) targeted to fibroblast growth factor (FGF) receptor 2 coding
CC sequences (ADH63049 and ADH63056), which specifically hybridize with and
CC inhibit FGF receptor 2 expression. The antisense oligonucleotides are
CC useful for treating or preventing diseases or conditions associated with
CC FGF receptor 2 in an animal, e.g. hyperproliferative disorders
CC (particularly cancer of the colon, lung, breast or skin), or
CC developmental disorders. The antisense compound may also be used in wound
CC healing. The antisense compounds are useful for diagnostics,
CC therapeutics, prophylaxis, or as research reagents or kits. ADH63059 is a
CC probe for FGF receptor 2 coding sequence.

XX Monitoring/detecting small molecule-biomolecule interactions for drug
PT screening involves contacting a solution of small molecules with
PT immobilized biomolecules and measuring the frequency generated with an
PT acoustic wave device.
XX Example 4; Fig 5; 44pp; English.
XX The present invention describes a device and method for monitoring small
CC molecule-biomolecule interactions. These involve the measurement of the
CC oscillation of a liquid when in contact with the biomolecule only
CC compared with the small molecule-biomolecule complex. This uses a
CC piezoelectric device and can be used with biomolecules such as DNA. The

```

CC present sequence was used as an example. The device can be used to screen  
 CC for drug candidates, to determine the conditions in which small molecules  
 CC will not bind to given biomolecules and to obtain information on the  
 CC tertiary structure of biomolecules

 XX Preparation of antisense oligo:nucleotide(s) which lack long runs of  
 PT consecutive guanosine or inosine - and have specific ratio of residues  
 PT able to form two or three hydrogen bonds, have greater activity and  
 PT reduced toxicity, used therapeutically or to modulate growth of cells in  
 PT culture.  
 XX Claim 10; Fig 8a; 286pp; English.

CC AAV4930-49007 represent antisense oligonucleotides directed against  
 CC transforming growth factor-beta2 (TGF-beta2). Of these, only  
 CC oligonucleotides AAV4930-67 resulted in significant reduction in TGF-  
 CC beta 2 protein expression, while oligonucleotides AAV48968-49007 had  
 CC little effect. The oligonucleotides exemplify the invention. The  
 CC specification describes oligonucleotides that contain 8-30 nucleotides,  
 CC which contain at most 8 nucleotides that can each form three hydrogen  
 CC bonds to cytosine; do not contain four consecutive nucleotides able to  
 CC form three H-bonds each to four consecutive cytosines; do not contain two  
 CC sequences of three consecutive nucleotides each able to form three H-  
 CC bonds to three consecutive cytosines, and the ratio between residues able  
 CC to form two H-bonds each (2R) or three such bonds (3R) is given by 2R/3R  
 CC = 0.33-0.72. The oligonucleotides are used to modulate expression of  
 CC genes, particularly the genes for p53, Erb-2, junB, jund, TGF-beta 1 or  
 CC beta 2 to control proliferation of primary cell cultures (e.g. bone  
 CC marrow stem, liver or kidney cells, osteoclasts, osteoblasts and/or  
 CC keratinocytes). The oligonucleotides can also be used to analyse function  
 CC of proteins (by altering their expression or activity) and  
 CC therapeutically, e.g. in cases of cancer or (targeting TGF) for

CC stimulating the immune system

 XX Composition containing immune stimulant and inhibitor of agent that  
 PT adversely affects the immune response, for treating cancers and  
 PT infections.  
 XX Claim 5; Fig 1; 30pp; English.

CC This sequence is an immunosuppressant inhibitor oligonucleotide, which is  
 CC used in the invention. The invention relates to a composition which  
 CC contains at least one inhibitor (less than 100 kb) of a substance (e.g.  
 CC transforming growth factor TGF-beta, vascular endothelial growth factor  
 CC VEGF, interleukin-10 IL-10, prostaglandin E2 PGE2, or their receptors)  
 CC that adversely affects the immune response. The composition also includes  
 CC at least one stimulant that positively affects the immune response. This  
 CC oligonucleotide is an example of an inhibitor that is used in the  
 CC composition. The composition is used as an immunostimulant for the  
 CC treatment of neoplasms and infections, particularly hyperproliferation;  
 CC leukaemia; (non-Hodgkin's lymphoma; carcinoma of oesophagus, bronchi,  
 CC colon-rectum, stomach, intestine, gall bladder or duct, pancreas, anus,  
 CC breast, ovary, cervix, endometrium, prostate or bladder), liver tumours,  
 CC malignant melanoma, brain tumours and sarcomas. The oligonucleotides,  
 CC most of which are directed against TGFbeta or VEGF, are inhibitors of  
 CC monocyte chemotactic protein-1 (MCP-1) and are useful as anti-  
 CC inflammatories for treating e.g. asthma, Crohn's disease, ulcerative  
 CC colitis, diabetes, glomerulonephritis, acute respiratory distress  
 CC syndrome and the formation of atherosclerotic plaque

CC specific and efficacious small double-stranded oligonucleotides (SDSO),  
CC antisense oligonucleotide molecules or short interfering RNA (siRNA)  
CC (comprising identifying a special pattern that can be localised in any  
CC position of an oligonucleotide sequence evaluating the specificity of a  
CC selected sequence). The short interfering RNA (siRNA) are targeted  
CC against genes involved in viral infection, malignant tumours, genetic and  
CC metabolic diseases. The methods are useful for designing and selecting  
CC short double-stranded oligonucleotides as a gene drug that can  
CC specifically inactivate a group of corresponding genes. The composition  
CC may be used for treating diseases or disorders associated with abnormal  
CC expression of genes in cells or tissues of humans or animals, such as  
CC viral infections, cancer, or genetic or metabolic diseases. The present  
CC sequence is a target region for an SDSO from an human cDNA.

CC The invention relates to a novel antisense compound of 8-80 nucleobases  
CC in length targeted to, and which specifically hybridizes with, a nucleic  
CC acid molecule encoding transforming growth factor (TGF)-beta 2, and  
CC inhibits the expression of TGF-beta 2. The invention further relates to:  
CC a compound 8-80 nucleobases in length that specifically hybridizes with  
CC at least an 8-nucleobase portion of an active site on a nucleic acid  
CC molecule encoding TGF-beta 2; a composition comprising the compound and a  
CC carrier or diluent; inhibiting the expression of TGF-beta 2 in cells or  
CC tissues by contacting the cells or tissues with the compound so that  
CC expression of TGF-beta 2 is inhibited; treating an animal having a

CC disease or condition associated with TGF-beta 2 by administering to the  
CC animal a therapeutic or prophylactic amount of the compound so that  
CC expression of TGF-beta 2 is inhibited; and screening an antisense  
CC compound. The antisense compound has cytostatic, nontropic,  
CC neuroprotective, and immunosuppressive activities. The compound,  
CC composition and methods are useful for treating a disease or condition  
CC associated with TGF-beta 2, such as a hyperproliferative disorder e.g.  
CC cancer, a neurodegenerative disorder, or a disease or condition involving  
CC hyperactivation of an immune response. This polynucleotide sequence  
CC represents a preferred target DNA region of TGF-beta 2 of the invention.

XX  
CC AAV48930-49007 represent antisense oligonucleotides directed against  
CC transforming growth factor-beta2 (TGF-beta2). Of these, only  
CC oligonucleotides AAV48930-67 resulted in significant reduction in TGF-  
CC beta 2 protein expression, while oligonucleotides AAV48968-49007 had  
CC little effect. The oligonucleotides exemplify the invention. The  
CC specification describes oligonucleotides that contain 8-30 nucleotides,  
CC which contain at most 8 nucleotides that can each form three hydrogen  
CC bonds to cytosine; do not contain four consecutive nucleotides able to  
CC form three H-bonds each to four consecutive cytosines; do not contain two  
CC sequences of three consecutive nucleotides each able to form three H-  
CC bonds to three consecutive cytosines, and the ratio between residues able  
CC to form two H-bonds each (2R) or three such bonds (3R) is given by 2R/3R  
CC = 0.33-0.72. The oligonucleotides are used to modulate expression of  
CC genes, particularly the genes for p53, Erb-2, junB, junD, TGF-beta 1 or  
CC beta 2 to control proliferation of primary cell cultures (e.g. bone  
CC marrow stem, liver or kidney cells, osteoclasts, osteoblasts and/or

CC keratinocytes). The oligonucleotides can also be used to analyse function  
CC of proteins (by altering their expression or activity) and  
CC therapeutically, e.g. in cases of cancer or (targeting TGF) for  
CC stimulating the immune system

PT Probes for detecting target nucleotide sequence in sample, has sequence  
PT that forms hairpin structure having a double-stranded segment and single-  
PT stranded loop collectively forming region complementary to target  
PT sequence.  
XX  
XX Example 5; Page 50; 72pp; English.  
XX  
PS The present sequence is that of oligonucleotide AGT02022, which contains  
CC a single mismatch with a target DNA oligonucleotide (see ABA91531). It is  
CC one of a set of oligonucleotides (see ABA91532-37) containing  
CC mismatch(es) to the target DNA that were tested in a hybridisation/RNase  
CC H cleavage assay. The results showed that 2 mismatches between the target  
CC and the probe ablated RNase H cleavage. The invention provides probes for  
CC nucleic acid hybridisation. The probes form a hairpin structure  
CC comprising a double-stranded stem and a single-stranded loop, and are  
CC capable of both intra-molecular and intermolecular hybridisation. The  
CC double-stranded stem may comprise a methylphosphonate DNA:RNA hybrid that  
CC is resistant to RNase H cleavage. When the probe hybridises with a target  
CC DNA, the RNA strand in the DNA:RNA duplex becomes sensitive to RNase H  
CC treatment and can be removed. Arrays and methods for nucleic acid

CC hybridisation using the probes are provided

XX (YINJ/) YIN J Q.
XX
XX Yin JQ;
XX
XX WPI; 2004-355427/33.
XX
XX Designing and selecting short double-stranded oligonucleotides for
XX treating viral infections, cancer and genetic or metabolic diseases,
XX comprises using gene chip and protein chip microarrays to identify
XX specific DNA sequences.
XX
XX Example 1; Page 18; 58pp; English.
XX
XX The invention relates to screening, identifying or predicting, and
XX assembling 19-25 nt double-stranded oligonucleotides (termed short double
XX stranded oligonucleotides, SDO) as active pharmaceutical compositions
XX for the treatment of viral infections, malignant tumours, and genetic and
XX metabolic diseases, comprising screening and identifying a specific DNA
XX sequence in an abnormal gene encoding a protein with gene chip and
XX protein chip microarrays. The above method comprises screening the
XX disease-causing genes over-expressing in cells and/or tissues, with the
XX gene chip and protein chip microarrays, identifying a specific DNA
XX sequence within the abnormal gene encoding a protein or playing other
XX biological roles with the assistance of computer and specific software,
XX predicting efficacious 19-25 nt double-stranded oligonucleotides with a
XX 5'-AU(T)CCG-3' or 5'-U(T)CCG-3' special pattern complementary to at
XX least a portion of an RNA molecule and making sure that selected sequence
XX is not localised within the stem-loop of target mRNA with any related
XX software. Also included are pharmaceutical compositions of gene drugs
XX (such as Dermogene, Lungene, Hepatogene, Leukogene, Lymphogene,
XX Prostagene, Breastogene, Brainumogene and Skin-whitogene including but
XX being not limited to part or all of the following components: single or a
XX group of specific 19-25 nt dsRNA, 19-25 nt sRNA-cDNA, 19-25 nt dsRNA
XX and/or single-stranded RNA and/or DNA with the special pattern, 5'-
XX CCGAT(U)-3' or its derivatives, one or more nucleic acid condensation
XX agents (or none), one or more pharmaceutical carriers, one or more
XX specific cell-targeting proteins and other active agents and selecting a
XX material) and a simplified method for predicting and selecting a
XX specific and efficacious small double-stranded oligonucleotides (SDSO),
XX antisense oligonucleotide molecules or short interfering RNA (siRNA)
XX (comprising identifying a special pattern that can be localised in any
XX position of an oligonucleotide sequence evaluating the specificity of a
XX selected sequence). The short interfering RNA (siRNA) are targeted
XX against genes involved in viral infection, malignant tumours, genetic and
XX metabolic diseases. The methods are useful for designing and selecting
XX short double-stranded oligonucleotides as a gene drug that can
XX specifically inactivate a group of corresponding genes. The composition
XX may be used for treating diseases or disorders associated with abnormal
XX expression of genes in cells or tissues of humans or animals, such as
XX viral infections, cancer, or genetic or metabolic diseases. The present
XX sequence is a target region for an SDO from an human cDNA.

 PS  
 CC AAV48930-49007 represent antisense oligonucleotides directed against  
 CC transforming growth factor-beta2 (TGF-beta2). Of these, only  
 CC oligonucleotides AAV48930-67 resulted in significant reduction in TGF-  
 CC beta 2 protein expression, while oligonucleotides AAV48968-49007 had  
 CC little effect. The oligonucleotides exemplify the invention. The  
 CC specification describes oligonucleotides that contain 8-30 nucleotides,  
 CC which contain at most 8 nucleotides that can each form three hydrogen  
 CC bonds to cytosine; do not contain four consecutive nucleotides able to  
 CC form three H-bonds each to four consecutive cytosines; do not contain two  
 CC sequences of three consecutive nucleotides each able to form three H-  
 CC bonds to three consecutive cytosines, and the ratio between residues able  
 CC to form two H-bonds each (2R) or three such bonds (3R) is given by 2R/3R  
 CC = 0.33-0.72. The oligonucleotides are used to modulate expression of  
 CC genes, particularly the genes for p53, Erb-2, JunB, JunD, TGF-beta 1 or  
 CC beta 2 to control proliferation of primary cell cultures (e.g. bone  
 CC marrow stem, liver or kidney cells, osteoclasts, osteoblasts and/or  
 CC keratinocytes). The oligonucleotides can also be used to analyse function  
 CC of proteins (by altering their expression or activity) and  
 CC therapeutically, e.g. in cases of cancer or (targeting TGF) for  
 CC stimulating the immune system

 XX  
 DR Composition containing immune stimulant and inhibitor of agent that  
 PT

PT adversely affects the immune response, for treating cancers and  
 XX infections.

PS Claim 5; Fig 1; 30pp; English.

XX This sequence is an immunosuppressant inhibitor oligonucleotide, which is  
 CC used in the invention. The invention relates to a composition which  
 CC contains at least one inhibitor (less than 100 kD) of a substance (e.g.  
 CC transforming growth factor TGF-beta, vascular endothelial growth factor  
 CC VEGF, interleukin-10 IL-10, prostaglandin E2 PGE2, or their receptors)  
 CC that adversely affects the immune response. The composition also includes  
 CC at least one stimulant that positively affects the immune response. This  
 CC oligonucleotide is an example of an inhibitor that is used in the  
 CC composition. The composition is used as an immunostimulant for the  
 CC treatment of neoplasms and infections, particularly hyperproliferation;  
 CC leukaemia; (non-)Hodgkin's lymphoma; carcinoma (of oesophagus, bronchi,  
 CC colon-rectum, stomach, intestine, gall bladder or duct, pancreas, anus,  
 CC breast, ovary, cervix, endometrium, prostate or bladder), liver tumours,  
 CC malignant melanoma, brain tumours and sarcomas. The oligonucleotides,  
 CC most of which are directed against TGFbeta or VEGF, are inhibitors of  
 CC monocyte chemotactic protein-1 (MCP-1) and are useful as anti-  
 CC inflammatory for treating e.g. asthma, Crohn's disease, ulcerative  
 CC colitis, diabetes, glomerulonephritis, acute respiratory distress  
 CC syndrome and the formation of atherosclerotic plaque

 PT atherosclerosis.

XX Example; Page 180; 242pp; English.

XX The present invention provides a method of diagnosing a vascular disease  
 CC in an individual, involving determining the sequence at various  
 CC polymorphic sites within the human thrombospondin 1 and thrombospondin 4  
 CC genes. The sequences at a number of polymorphic sites are also provided  
 CC in the specification. In particular, the method can be used in the  
 CC diagnosis of atherosclerosis, myocardial infarction, coronary heart  
 CC disease, stroke, peripheral vascular diseases, venous thromboembolism and  
 CC pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also  
 CC useful in forensics, paternity testing, genetic analysis and phenotype  
 CC correlations to diseases. The present sequence is an example of one of  
 CC the human gene SNPs shown in the specification

XX Novel reusable protein chip useful for protein extraction, and protein  
PT quantification, can quantitate proteins with very high sensitivity.

XX Example; Page 52; 68pp; English.

XX The present invention relates to a new reusable protein chip (P-chip)  
CC microarray which can quantitate at least a few hundred proteins with a  
CC sensitivity not less than 10 pg/ml. The invention is useful for  
CC quantitating low abundance proteins and the P-chip is suitable for Ab1-P-  
CC Ab2 sandwich format with sensitivity better than 100 fg/ml for a majority  
CC of targets. The P-chip microarray of the invention is capable of  
CC detecting low abundance proteins from physiologic fluids that exist in  
CC concentrations smaller than 0.1 pg/ml. This superior sensitivity of P-  
CC chips allows them to be low cost, reliable and reusable. The present  
CC nucleic acid sequence forms a streptavidin-ds-DNA construct along with  
CC DNA sequence #4 (AAS17231). This construct was used in the invention to  
CC produce a reusable P-chip with a thermally decoupled linker

XX  
XX PT Designing and selecting short double-stranded oligonucleotides for  
PT treating viral infections, cancer and genetic or metabolic diseases,  
PT comprises using gene chip and protein chip microarrays to identify  
PT specific DNA sequences.  
XX  
XX Example 1; Page 18; 59pp; English.  
XX  
XX The invention relates to screening, identifying or predicting, and  
XX assembling 19-25 nt double-stranded oligonucleotides (termed short double  
XX stranded oligonucleotides, SDSO) as active pharmaceutical compositions  
XX for the treatment of viral infections, malignant tumours, and genetic and  
XX metabolic diseases, comprising screening and identifying a specific DNA  
XX sequence in an abnormal gene encoding a protein with gene chip and  
XX protein chip microarrays. The above method comprises screening the  
XX disease-causing genes, over-expressing in cells and/or tissues, with the  
XX gene chip and protein chip microarrays, identifying a specific DNA  
XX sequence within the abnormal gene encoding a protein or playing other  
XX biological roles with the assistance of computer and specific software,  
XX predicting efficacious 19-25 nt double-stranded oligonucleotides with a  
XX 5'-AU(T)CCG-3' or 5'-U(T)CCC-3', special pattern complementary to at  
XX least a portion of an RNA molecule and making sure that selected sequence  
XX is not localised within the stem-loop of target mRNA with any related  
XX software. Also included are pharmaceutical compositions of gene drugs  
XX (such as Dermogene, Lungene, Hepatogene, Leukogene, Lymphogene,  
XX Prostogene, Breastogene, Braintumogene and Skin-whitogene including but  
XX being not limited to part or all of the following components: single or a  
XX group of specific 19-25 nt dsRNA, 19-25 nt srRNA-cDNA, 19-25 nt dsRNA  
XX and/or single-stranded RNA and/or DNA with the special pattern, 5'-  
XX CCGAT(U)-3' or its derivatives, one or more nucleic acid condensation  
XX agents (or none), one or more pharmaceutical carriers, one or more  
XX specific cell-targeting proteins and other active agents and additional  
XX materials) and a simplified method for predicting and selecting a  
XX specific and efficacious small double-stranded oligonucleotides (SDSO),  
XX antisense oligonucleotide molecules or short interfering RNA (siRNA)  
XX (comprising identifying a special pattern that can be localised in any  
XX position of an oligonucleotide sequence evaluating the specificity of a  
XX selected sequence). The short interfering RNA (siRNA) are targeted  
XX against genes involved in viral infection, malignant tumours, genetic and  
XX metabolic diseases. The methods are useful for designing and selecting  
XX short double-stranded oligonucleotides as a gene drug that can  
XX specifically inactivate a group of corresponding genes. The composition  
XX may be used for treating diseases or disorders associated with abnormal  
XX expression of genes in cells or tissues of humans or animals, such as  
XX viral infections, cancer, or genetic or metabolic diseases. The present

XX PT New nucleic acids other than naturally occurring chromosomes encoding  
PT ASTH1 protein, for e.g. screening compositions that modulate expression  
PT or function of ASTH1 proteins or as diagnostics for genetic  
PT predisposition to asthma.  
XX  
XX Example; Col 41-42; 131pp; English.  
XX  
XX The invention relates to the ASTH1 locus on the short arm of human  
XX chromosome (11p). This locus comprises the ASTH11 and ASTH1J genes, which  
XX are associated with a genetic predisposition to asthma and bronchial  
XX hyperreactivity. The ASTH11 and ASTH1J genes are oriented in opposite  
XX directions with the ASTH1 locus, and have similar patterns of expression  
XX and common sequence motifs. They are both expressed in trachea, lung and  
XX several other tissues. ASTH11 and ASTH1J are novel members of the ets  
XX family of transcription factors, which have been implicated in the  
XX activation of a variety of genes including the TCRA gene and cytokine  
XX genes known to be important in the aetiology of asthma. Both ASTH11 and  
XX ASTH1J mRNAs are alternatively spliced. Alternative splicing of  
XX transcripts has no effect on the open reading frame of ASTH1J, as the  
XX exons involved are all 5' to the start codon in exon b. In contrast,  
XX alternative splicing of ASTH11 transcripts results in 3 different ASTH11  
XX isoforms. The invention also encompasses mouse asth1j protein. The ASTH11  
XX nucleic acids are useful as diagnostics to identify a hereditary  
XX predisposition to asthma, as probes for identifying ASTH1 related genes,  
XX for identifying expression of the gene in a biological specimen, and for  
XX generating genetically modified non-human animals or site specific gene  
XX modifications in cell lines. The encoded ASTH1 proteins are useful as

CC immunogens to raise specific antibodies; in drug screening for  
 CC compositions that mimic or modulate activity or expression of ASTH11  
 CC and/or ASTH1J (including altered forms of these proteins); and as a  
 CC therapeutic. The ASTH1 genes or fragments thereof, encoded proteins,  
 CC ASTH1 genomic regulatory regions, and anti-ASTH11 and anti-ASTH1J  
 CC antibodies are useful in the identification of individuals predisposed to  
 CC development of asthma, and for modulation of gene activity in vivo for  
 CC prophylactic and therapeutic purposes. The intact ASTH11 or ASTH1J  
 CC proteins or active fragments thereof may be used to modulate or reduce  
 CC bronchial hyperreactivity. Sequences AAA80260-A80261 and AAA80264-A80416  
 CC represent polymorphic sites within the ASTH1J or ASTH11 genes

CC disease or condition associated with TGF-beta 2 by administering to the

CC animal a therapeutic or prophylactic amount of the compound so that

CC expression of TGF-beta 2 is inhibited; and screening an antisense

CC compound. The antisense compound has cytostatic, nontropic,

CC neuroprotective, and immunosuppressive activities. The compound,

CC composition and methods are useful for treating a disease or condition

CC associated with TGF-beta 2, such as a hyperproliferative disorder e.g.

CC cancer, a neurodegenerative disorder, or a disease or condition involving

CC hyperactivation of an immune response. This polynucleotide sequence

CC represents a preferred target DNA region of TGF-beta 2 of the invention.

XX New isolated polypeptide having fibrillin-like activity, useful for  
 manufacturing a medicament for treating e.g., skin damage, multiple  
 sclerosis, cancer, osteoarthritis, cardiovascular disease and hepatitis.

XX Example 3; Page 50; 150pp; English.

XX The invention comprises the amino acid and coding sequences of human  
 fibrillin-like proteins. The DNA and protein sequences of the invention  
 are useful for characterising ligands which bind to fibrillin-like  
 proteins. The DNA and protein sequences of the invention are useful for  
 the treatment of diseases and conditions in which fibrillin-like proteins  
 are implicated, such as: skin damage (e.g. through ageing, injuries or  
 sun exposure), multiple sclerosis, cancer, osteoarthritis, rheumatoid  
 arthritis, osteoporosis, cardiovascular diseases and fibrosis (e.g. liver  
 fibrosis or kidney fibrosis), renal disorders and hepatitis. The DNA and  
 protein sequences of the invention are also useful for bone, joint or  
 ligament reconstruction after fractures or lesions. The present DNA  
 sequence represents a primer that was used in an example of the  
 invention.

 XX Preparation of antisense oligo:nucleotide(s) which lack long runs of

PT consecutive guanosine or inosine - and have specific ratio of residues  
 PT able to form two or three hydrogen bonds, have greater activity and  
 PT reduced toxicity, used therapeutically or to modulate growth of cells in  
 PT culture.  
 XX Claim 10; Fig 8a; 286pp; English.  
 PS  
 XX AAV48930-49007 represent antisense oligonucleotides directed against  
 CC transforming growth factor-beta2 (TGF-beta2). Of these, only  
 CC oligonucleotides AAV48930-67 resulted in significant reduction in TGF-  
 CC beta 2 protein expression, while oligonucleotides AAV48968-49007 had  
 CC little effect. The oligonucleotides exemplify the invention. The  
 CC specification describes oligonucleotides that contain 8-30 nucleotides,  
 CC which contain at most 8 nucleotides that can each form three hydrogen  
 CC bonds to cytosine; do not contain four consecutive nucleotides able to  
 CC form three H-bonds each to four consecutive cytosines; do not contain two  
 CC sequences of three consecutive nucleotides each able to form three H-  
 CC bonds to three consecutive cytosines, and the ratio between residues able  
 CC to form two H-bonds each (2R) or three such bonds (3R) is given by 2R/3R  
 CC = 0.33-0.72. The oligonucleotides are used to modulate expression of  
 CC genes, particularly the genes for p53, ErbB-2, junB, junD, TGF-beta 1 or  
 CC beta 2 to control proliferation of primary cell cultures (e.g. bone  
 CC marrow stem, liver or kidney cells, osteoclasts, osteoblasts and/or  
 CC keratinocytes). The oligonucleotides can also be used to analyse function  
 CC of proteins (by altering their expression or activity) and  
 CC therapeutically, e.g. in cases of cancer or (targeting TGF) for  
 CC stimulating the immune system

PT Composition containing immune stimulant and inhibitor of agent that
PT adversely affects the immune response, for treating cancers and
PT infections.
XX
XX Claim 10; Fig 1; 30pp; English.
XX
XX This sequence is an immunosuppressant inhibitor oligonucleotide, which is
CC used in the invention. The invention relates to a composition which
CC contains at least one inhibitor (less than 100 kD) of a substance (e.g.
CC transforming growth factor TGF-beta, vascular endothelial growth factor
CC VEGF, interleukin-10 IL-10, prostaglandin E2 PGE2, or their receptors)
CC that adversely affects the immune response. The composition also includes
CC at least one stimulant that positively affects the immune response. This
CC oligonucleotide is an example of an inhibitor that is used in the
CC composition. The composition is used as an immunostimulant for the
CC treatment of neoplasms and infections, particularly hyperproliferation;
CC leukaemia; (non-)Hodgkin's lymphoma; carcinoma (of oesophagus, bronchi,
CC colon-rectum, stomach, intestine, gall bladder or duct, pancreas, anus,
CC breast, ovary, cervix, endometrium, prostate or bladder), liver tumours,
CC malignant melanoma, brain tumours and sarcomas. The oligonucleotides,
CC most of which are directed against TGFbeta or VEGF, are inhibitors of
CC monocyte chemotactic protein-1 (MCP-1) and are useful as anti-
CC inflammatory for treating e.g. asthma, Crohn's disease, ulcerative
CC colitis, diabetes, glomerulonephritis, acute respiratory distress
CC syndrome and the formation of atherosclerotic plaque

```

XX The present invention describes a method of testing for bronchial asthma  
 CC or chronic obstructive pulmonary disease. The method comprises  
 CC determining the expression level of a marker gene in a biological sample  
 CC from a subject, comparing the expression level determined with the  
 CC expression level of the marker gene in a biological sample from a healthy  
 CC subject, and judging whether the subject has bronchial asthma or chronic  
 CC obstructive pulmonary disease. The marker gene comprises: (a) a group of  
 CC genes (S1) whose expression levels increase when respiratory epithelial  
 CC cells are stimulated with interleukin-13; or (b) a group of genes (S2)  
 CC whose expression levels decrease when respiratory epithelial cells are  
 CC stimulated with interleukin-13. Also described: (1) a reagent (I) for  
 CC testing for bronchial asthma or chronic obstructive pulmonary disease;  
 CC (2) a kit for screening for a candidate compound for a therapeutic agent  
 CC to treat bronchial asthma or chronic obstructive pulmonary disease; (3)  
 CC an animal model for bronchial asthma or chronic obstructive pulmonary  
 CC disease; (4) an inducer that induces bronchial asthma in a mouse; (5) a  
 CC method for producing an animal model for bronchial asthma or chronic  
 CC obstructive pulmonary disease; (6) a therapeutic agent for bronchial  
 CC asthma or chronic obstructive pulmonary disease, comprising the compound,  
 CC a marker gene or an antisense nucleic acid corresponding to a portion of  
 CC the marker gene, a ribozyme, a polynucleotide that suppresses the  
 CC expression of the gene through an RNAi effect or an antibody recognising  
 CC a protein encoded by a marker gene; and (7) a DNA chip for testing for  
 CC bronchial asthma or a chronic obstructive pulmonary disease, on which a  
 CC probe has been immobilised to assay a marker gene. (I) has respiratory  
 CC and antiasthmatic activities, and can be used in gene therapy. The method  
 CC is useful for testing for or screening for a therapeutic agent for  
 CC bronchial asthma or chronic obstructive pulmonary disease. The present  
 CC invention is used in the exemplification of the present invention.

XX Hybrid transforming growth factor beta-1/TGF-beta-2 precursor - used to

XX produce biologically active, mature TGF-beta-2.

XX Example 6; Page 13; 52pp; English.

XX This probe is used during a procedure for the cloning of TGF-beta2

XX precursor from human prostate adenocarcinoma cell line PC-3. DS cDNA was

XX synthesized from polyadenylated RNACC isolated from PC-3 cells treated

XX with tamoxifen for 24 hr. cDNA fractions larger than 1000 bases were

XX cloned into phage lambda gt10. The library was first screened in duplicate

XX with a 32P-labelled 24-mer degenerate probe (AAQ04118) complimentary to

XX DNA encoding AA WKWIEP which are conserved between TGF-beta1 and TGF-

XX beta2. Positive clones were then screened with this 2nd degenerate probe

XX (AAQ04119). (Updated on 25-MAR-2003 to correct PF field.)

| XX         |   |  |
| CC         | The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known as FGFR-3, ACH, JTK4 and CER2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or hyperproliferative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutics, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human FGFR-3 |  |

 CC The antisense oligonucleotides are useful in the treatment of tumours in  
 CC which expression of TGF-beta is of relevance for pathogenicity and/or  
 CC inhibition of pathological angiogenesis. They are used especially for the  
 CC treatment of the immunosuppressive effect of TGF-beta, augmentation of  
 CC the proliferation of cytotoxic lymphocytes, treatment of endogenous  
 CC hyperexpression of TGF-beta, treatment of breast tumours, neurofibromas  
 CC and malignant gliomas, including glioblastomas, treatment and prophylaxis  
 CC of skin carcinogenesis, and treatment of oesophageal and gastric  
 CC carcinomas. See AAQ78352-Q78488. The sequences given in GENESBQ files  
 CC AAQ78352-Q78407 and AAQ78488 are antisense oligodeoxynucleotides of TGF-  
 CC beta 1. The sequences given in GENESBQ files AAQ78408-78487 are antisense  
 CC oligodeoxynucleotides of TGF-beta 2 in the form of phosphorothioate  
 CC analogues. (Updated on 25-MAR-2003 to correct PN field.)

 XX Prodn. of heterologous non-bacterial protein in bacteria - using a  
 PT chromosomal transfer DNA contg. a gene which has not been cloned in a  
 PT multi-copy vector.  
 PT  
 XX Example 6; Page 40; 80pp; English.  
 PS  
 XX A method has been produced for the production of a heterologous,  
 CC preferably non-bacterial, protein in a bacterial host cell such as  
 CC Escherichia coli. The method involves: transferring a chromosomal DNA  
 CC into a bacterial host cell preferably comprising a chromosome, where the  
 CC chromosomal DNA contains at least one copy of a gene encoding the  
 CC heterologous protein and a selectable marker; selecting for integration  
 CC of the chromosomal DNA into the cell resulting in a host cell chromosome  
 CC comprising a gene encoding the heterologous protein operably linked to a

CC promoter functional in the host cell and a selectable marker flanked by  
 CC duplicate DNA; and expressing the gene, where the gene is at no time  
 CC operably linked to a promoter, functional in the host cell, on a  
 CC multicopy number plasmid vector during construction of the transfer DNA  
 CC and where the heterologous protein accumulates within the host cell to a  
 CC level in excess of 0.1% of total cell protein. The present sequence is  
 CC PCR primer beta21079, which is part of a primer pair used to confirm the  
 CC proper integration of intact chromosomal transfer DNA. The method is  
 CC especially useful for producing eukaryotic protein, especially mammalian  
 CC protein. The method of construction avoids the generation of low or high  
 CC multicopy plasmid where expression of a small amount of the foreign  
 CC protein may be toxic to the cell. The method allows high accumulation of  
 CC the foreign protein (about 20% of total cell protein) from low  
 CC (approximately 2) copies of the gene encoding the heterologous protein

 XX  
 CC AAV48930-49007 represent antisense oligonucleotides directed against  
 CC transforming growth factor-beta2 (TGF-beta2). Of these, only  
 CC oligonucleotides AAV48930-67 resulted in significant reduction in TGF-  
 CC beta 2 protein expression, while oligonucleotides AAV48968-49007 had  
 CC little effect. The oligonucleotides exemplify the invention. The  
 CC specification describes oligonucleotides that contain 8-30 nucleotides,  
 CC which contain at most 8 nucleotides that can each form three hydrogen  
 CC bonds to cytosine; do not contain four consecutive nucleotides able to  
 CC form three H-bonds each to four consecutive cytosines; do not contain two  
 CC sequences of three consecutive nucleotides each able to form three H-  
 CC bonds to three consecutive cytosines, and the ratio between residues able  
 CC to form two H-bonds each (2R) or three such bonds (3R) is given by 2R/3R  
 CC = 0.33-0.72. The oligonucleotides are used to modulate expression of  
 CC genes, particularly the genes for p53, ErbB-2, JunB, JunD, TGF-beta 1 or  
 CC beta 2 to control proliferation of primary cell cultures (e.g. bone  
 CC marrow stem, liver or kidney cells, osteoclasts, osteoblasts and/or  
 CC keratinocytes). The oligonucleotides can also be used to analyse function  
 CC of proteins (by altering their expression or activity) and  
 CC therapeutically, e.g. in cases of cancer or (targeting TGF) for  
 CC stimulating the immune system

XX PT Composition containing immune stimulant and inhibitor of agent that

XX PT adversely affects the immune response, for treating cancers and

XX PT infections.

XX PS Claim 5; Fig 1; 30pp; English.

XX CC This sequence is an immunosuppressant inhibitor oligonucleotide, which is

CC used in the invention. The invention relates to a composition which

CC contains at least one inhibitor (less than 100 kb) of a substance (e.g.

CC transforming growth factor TGF-beta, vascular endothelial growth factor

CC VEGF, interleukin-10 IL-10, prostaglandin E2 PGE2, or their receptors)

CC that adversely affects the immune response. The composition also includes

CC at least one stimulant that positively affects the immune response. This

CC oligonucleotide is an example of an inhibitor that is used in the

CC composition. The composition is used as an immunostimulant for the

CC treatment of neoplasms and infections, particularly hyperproliferation;

CC leukaemia; (non-)Hodgkin's lymphoma; carcinoma (of oesophagus, bronchi,

CC colon-rectum, stomach, intestine, gall bladder or duct, pancreas, anus,

CC breast, ovary, cervix, endometrium, prostate or bladder), liver tumours,

CC malignant melanoma, brain tumours and sarcomas. The oligonucleotides,

CC most of which are directed against TGFbeta or VEGF, are inhibitors of

CC monocyte chemotactic protein-1 (MCP-1) and are useful as anti-

CC inflammatory for treating e.g. asthma, Crohn's disease, ulcerative

CC colitis, diabetes, glomerulonephritis, acute respiratory distress

CC syndrome and the formation of atherosclerotic plaque

XX PT Quadruplex nucleic acid and antibody binding assay useful for detecting

XX PT and purifying antibodies and nucleic acids from a biological sample.

XX PS Example 4; Col 10; 11pp; English.

XX CC A method has been developed for binding quadruplex nucleic acids. The

CC method comprises contacting a quadruplex nucleic acid with a monoclonal

CC antibody that selectively binds to quadruplex nucleic acid to form an

CC antibody-quadruplex nucleic acid complex. The method can be used for

CC detecting antibodies that bind to quadruplex nucleic acids and to collect

CC antibodies that bind to quadruplex nucleic acids. The method is also

CC suitable for detecting, isolating and purifying quadruplex nucleic acids.

CC The detecting step can be carried out on a biological sample such as

CC cerebrospinal fluid, tissues samples, blood samples or other sample

CC suspected of containing quadruplex nucleic acids. The method can be used

CC for the purification of quadruplex nucleic acids from solutions and to

CC purify aptamers from combinatorial libraries or heterogeneous solutions,

CC in particular to purify or detect DNA aptamers that specifically bind the

CC thrombin molecule critical in the thrombin-catalysed, fibrin-clot

CC formation cascade of blood platelets. The antibodies can then be used to

CC detect levels of a known therapeutic aptamer in a patient and monitor

CC clearance and dosage levels in a treatment protocol involving the

CC aptamer. The present sequence represents an oligonucleotide used in the

CC exemplification of the present invention

XX PT Quadruplex nucleic acid and antibody binding assay useful for detecting

XX PT and purifying antibodies and nucleic acids from a biological sample.

XX PS Example 4; Col 10; 11pp; English.

XX CC A method has been developed for binding quadruplex nucleic acids. The

CC method comprises contacting a quadruplex nucleic acid with a monoclonal

CC antibody that selectively binds to quadruplex nucleic acid to form an

CC antibody-quadruplex nucleic acid complex. The method can be used for

CC detecting antibodies that bind to quadruplex nucleic acids and to collect

CC antibodies that bind to quadruplex nucleic acids. The method is also

CC suitable for detecting, isolating and purifying quadruplex nucleic acids.

CC The detecting step can be carried out on a biological sample such as

CC cerebrospinal fluid, tissues samples, blood samples or other sample

CC suspected of containing quadruplex nucleic acids. The method can be used

CC for the purification of quadruplex nucleic acids from solutions and to

CC purify aptamers from combinatorial libraries or heterogeneous solutions,

CC in particular to purify or detect DNA aptamers that specifically bind the

CC thrombin molecule critical in the thrombin-catalysed, fibrin-clot

CC formation cascade of blood platelets. The antibodies can then be used to

CC detect levels of a known therapeutic aptamer in a patient and monitor

CC clearance and dosage levels in a treatment protocol involving the

CC aptamer. The present sequence represents an oligonucleotide used in the

CC exemplification of the present invention

XX Probes for detecting target nucleotide sequence in sample, has sequence  
XX that forms hairpin structure having a double-stranded segment and single-  
XX stranded loop collectively forming region complementary to target  
XX sequence.

XX Example 5; Page 49; 72pp; English.

XX The present sequence is that of oligonucleotide AGT02020, which contains  
XX a single mismatch with a target DNA oligonucleotide (see ABA91531). It is  
XX one of a set of oligonucleotides (see ABA91532-37) containing  
XX mismatch(es) to the target DNA that were tested in a hybridisation/RNase  
XX H cleavage assay. The results showed that 2 mismatches between the target  
XX and the probe ablated RNase H cleavage. The effect of one mismatch site  
XX was less than that of two mismatch sites, and showed a polarity effect,  
XX with stronger inhibition shown in assays with AGT02020 than in assays  
XX using an oligonucleotide in which the mismatch was at an adjacent  
XX position. The invention provides probes for nucleic acid hybridisation.  
XX The probes form a hairpin structure comprising a double-stranded stem and  
XX a single-stranded loop, and are capable of both intramolecular and

CC intermolecular hybridisation. The double-stranded stem may comprise a  
CC methylphosphonate DNA:RNA hybrid that is resistant to RNase H cleavage.  
CC When the probe hybridises with a target DNA, the RNA strand in the  
CC DNA:RNA duplex becomes sensitive to RNase H treatment and can be removed.  
CC Arrays and methods for nucleic acid hybridisation using the probes are  
CC provided

XX  
XX Pharmaceutical composition for treating asthma, has antisense  
XX oligonucleotide containing less percentage of adenosine, targeted to  
XX nucleic acids associated with lung airway or lung dysfunction, and  
XX bronchodilating agent.  
XX  
XX Claim 15; SEQ ID NO 1302; 763pp; English.  
XX  
XX This invention describes a novel composition (a) a first active agent,  
XX comprising oligonucleotides, effective for alleviating  
XX bronchoconstriction, respiratory tract inflammation, allergies and  
XX reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,  
XX surfactant depletion or hyposecretion, when administered to a mammal. The  
XX oligonucleotides are derived from a gene encoding or regulating  
XX expression of a target polypeptide associated with lung airway or lung  
XX dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
XX The invention also describes a kit, that comprises: (a) a delivery  
XX device, in separate containers, (b) the oligonucleotides, (c)  
XX instructions for adding a carrier and for use of the kit. The composition  
XX of the invention has antiasthmatic, antiinflammatory, antiasthmatic,  
XX analgesic, hypotensive, immunosuppressive and cytostatic activity, is a  
XX beta-adrenergic agonist. The composition is useful for preventing or  
XX treating a respiratory, lung or malignant disease. The administered  
XX composition comprises oligo and is administered to reduce the production  
XX or availability, or to increase the degradation of the target mRNA or to  
XX reduce the amount of target polypeptide present in the lungs. The  
XX pulmonary obstruction, and/or surfactant hypoproduction are associated  
XX with inflammation, allergies, asthma, impeded respiration, respiratory

XX Pharmaceutical composition for treating asthma, has antisense  
XX oligonucleotide containing less percentage of adenosine, targeted to  
XX nucleic acids associated with lung airway or lung dysfunction, and  
XX bronchodilating agent.  
XX  
XX Claim 15; SEQ ID NO 4834; 763pp; English.  
XX  
XX This invention describes a novel composition (a) a first active agent,  
XX comprising oligonucleotides, effective for alleviating  
XX bronchoconstriction, respiratory tract inflammation, allergies and  
XX reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,  
XX surfactant depletion or hyposecretion, when administered to a mammal. The  
XX oligonucleotides are derived from a gene encoding or regulating  
XX expression of a target polypeptide associated with lung airway or lung  
XX dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
XX The invention also describes a kit, that comprises: (a) a delivery  
XX device, in separate containers, (b) the oligonucleotides, (c)  
XX instructions for adding a carrier and for use of the kit. The composition  
XX of the invention has antiasthmatic, antiinflammatory, antiasthmatic,  
XX analgesic, hypotensive, immunosuppressive and cytostatic activity, is a  
XX beta-adrenergic agonist. The composition is useful for preventing or  
XX treating a respiratory, lung or malignant disease. The administered  
XX composition comprises oligo and is administered to reduce the production  
XX or availability, or to increase the degradation of the target mRNA or to  
XX reduce the amount of target polypeptide present in the lungs. The  
XX pulmonary obstruction, and/or surfactant hypoproduction are associated  
XX with inflammation, allergies, asthma, impeded respiration, respiratory  
XX distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary  
XX hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary  
XX transplantation rejection, pulmonary infections, bronchitis or cancer.  
XX The reduced adenosine content of the anti-sense oligos corresponding to  
XX thymidines present in the target RNA serves to prevent the breakdown of  
XX the oligonucleotides into products that free adenosine into the system  
XX e.g., lung, brain, heart, kidney, etc., tissue environment and thereby, to  
XX prevent any unwanted effects due to it

New antisense compound targeted to a nucleic acid molecule encoding
PT mammalian glucocorticoid receptor, useful for treating diabetes, obesity,
PT cardiovascular disorder, hyperlipidemia or Cushing's syndrome.
XX
PS Claim 4; SEQ ID NO 4141; 985pp; English.
XX
The invention comprises an antisense oligonucleotides that are targeted
CC to nucleic acids encoding a mammalian glucocorticoid receptor. The
CC antisense oligonucleotides of the invention are useful for preventing or
CC delaying infection, inflammation or tumour formation. The antisense
CC oligonucleotides are also useful for treating diabetes, obesity,
CC cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The
CC present DNA sequence represents an antisense oligonucleotide that targets
CC the human glucocorticoid receptor gene. NOTE: The present sequence
CC contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.

New compounds, particularly antisense oligonucleotides targeted to a
PT nucleic acid encoding TGF-beta 2, useful for treating cancer, a
PT neurodegenerative disorder, or a disease involving hyperactivation of
PT immune response.
XX
PS Example 16; SEQ ID NO 181; 135pp; English.
XX
The invention relates to a novel antisense compound of 8-80 nucleobases
CC in length targeted to, and which specifically hybridizes with, a nucleic
CC acid molecule encoding transforming growth factor (TGF)-beta 2, and
CC inhibits the expression of TGF-beta 2. The invention further relates to:
CC a compound 8-80 nucleobases in length that specifically hybridizes with
CC at least an 8-nucleobase portion of an active site on a nucleic acid
CC molecule encoding TGF-beta 2; a composition comprising the compound and a
CC carrier or diluent; inhibiting the expression of TGF-beta 2 in cells or
CC tissues by contacting the cells or tissues with the compound so that
CC expression of TGF-beta 2 is inhibited; treating an animal having a
CC disease or condition associated with TGF-beta 2 by administering to the
CC animal a therapeutic or prophylactic amount of the compound so that
CC expression of TGF-beta 2 is inhibited; and screening an antisense
CC compound. The antisense compound has cytostatic, notropic,
CC neuroprotective, and immunosuppressive activities. The compound,
CC composition and methods are useful for treating a disease or condition
CC associated with TGF-beta 2, such as a hyperproliferative disorder e.g.
CC cancer, a neurodegenerative disorder, or a disease or condition involving
CC hyperactivation of an immune response. This polynucleotide sequence
CC represents a preferred target DNA region of TGF-beta 2 of the invention.

PT with Nav1.3, e.g. pain, seizure disorder such as childhood seizure  
PT disorder, or ataxia.  
XX  
PS Claim 4; SEQ ID NO 529; 417pp; English.

XX The present invention relates to an antisense compound targeted to a  
 CC nucleic acid molecule encoding Nav1.3, where the antisense compound  
 CC specifically hybridizes with and inhibits the expression of Nav1.3. The  
 CC compound and composition are useful for treating a disease or condition  
 CC associated with Nav1.3, e.g. pain including but not limited to  
 CC neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain,  
 CC diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain,  
 CC pain from burns, migraine headache, cluster headache, mild-to-moderate  
 CC headache; seizure disorder such as childhood seizure disorder, including  
 CC but not limited to neonatal or infantile epilepsy; or ataxia. The present  
 CC sequence represents a chimeric phosphorothioate oligonucleotide with  
 CC 2'MOE wings and a deoxy gap. Used during the antisense inhibition of  
 CC human Nav1.3 expression, the oligonucleotides are designed to target  
 CC different regions of the human Nav1.3 RNA.

 PT Farnesoid X Receptor (FXR) or for treating diseases associated with FXR,  
 PT e.g. diabetes, immunological disorders, cardiovascular disorders,  
 PT gallstones or obesity.  
 XX  
 XX Claim 4; SEQ ID NO 447; 150pp; English.  
 PS  
 XX The invention relates to an antisense compound 8-30 nucleobases in length  
 CC targeted to a nucleic acid molecule encoding Farnesoid X receptor (FXR),  
 CC where the antisense compound specifically hybridizes with and inhibits  
 CC the expression of FXR. The composition and methods are useful for

CC inhibiting the expression of FXR (Farnesoid X receptor) in cells or  
 CC tissues, or for treating diseases or conditions associated with FXR, such  
 CC as diabetes, immunological disorders, cardiovascular disorders, e.g.  
 CC dyslipidemia and its symptoms, atherosclerosis, low HDL (high density  
 CC lipoprotein), elevated LDL (low density lipoprotein) or  
 CC hypercholesterolemia, gallstones, hypertriglyceridemia, obesity,  
 CC neurological disorders, or ischemia/reperfusion injury. In addition, the  
 CC composition is used for diagnostics, prophylaxis, or as research reagents  
 CC or kits. This sequence corresponds to an antisense oligonucleotide of the  
 CC invention.

 DR Fluorescently-labeled nucleic acid probes for assaying nucleic acids and  
 XX their polymorphism and mutation, particularly useful in science and  
 PT medicine for e.g. analytical applications, disease diagnosis and  
 PT microbial identification.  
 XX Example 12; Page 60; 152pp; Japanese.  
 CC The present invention relates to nucleic acid probes, which are useful  
 CC for assaying nucleic acids by hybridising with a target nucleic acid, in  
 CC which a single-stranded oligonucleotide is labelled with a fluorescent  
 CC substance and a quencher in a manner that the fluorescence intensity of  
 CC the hybridisation reaction system is increased after completion of the  
 CC hybridisation but no stem loop structure is formed. The probes are useful  
 CC for assaying nucleic acids and their polymorphism and mutation,  
 CC particularly useful for e.g. analytical applications, disease diagnosis  
 CC and microbial identification. The present sequence was used to illustrate  
 CC the invention

 XX  
 CC The invention relates to a novel method for selecting siRNA (short  
 CC interfering RNA) comprising selecting an siRNA molecule of 19-25  
 CC nucleoside bases by selecting a target gene and measuring the  
 CC functionality of sequences of 19-25 nucleotides in length that are  
 CC substantially complementary to a stretch of nucleotides of the target  
 CC sequence, where the functionality is dependent upon non-target specific  
 CC criteria. Also claimed are methods for gene-silencing, developing an  
 CC siRNA algorithm for selecting siRNA, selecting an siRNA with improved  
 CC functionality, selecting hyperfunctional siRNA, an siRNA molecule  
 CC effective at silencing Bcl-2, and a kit for gene silencing comprising the  
 CC siRNA. The siRNA molecule comprises a sequence substantially similar to a  
 CC sequence consisting of GGGAGUAGUGAUGAUGA; GAAGUACUCCUAGUAG;  
 CC GUACGACACCGGAGUA; AGAUAGUAGUAGUAGU; UGAAGACUCUGCUCAGUUU;  
 CC GUAGGCGCUCUGUUUGA; UCGGCGCUCUGUUUGA; GAGUAGUGAUGAUGA;  
 CC GGAGUAGUGAUGAUGA; and GAAGACUCUCUGCUCAGUUU. The siRNA molecule  
 CC comprises a sense strand and an anti-sense strand. The siRNA molecule  
 CC comprises a hairpin. The siRNA molecule comprises between 18 and 30 bases

CC pairs. The kit comprises at least two siRNA, comprising a first optimised  
CC siRNA and a second optimised siRNA. The method is useful in selecting  
CC siRNA for generating a gene silencing reagent. The present sequence is  
CC used in the exemplification of the invention. The sequence is shown in  
CC the specification as DNA, but described as siRNA.

XX PT Determining common functional alleles in a population - useful in the  
XX PT diagnosis of disease associated with allelic heterogeneity.

XX PS Example 1; Page 24; 78pp; English.

XX CC The invention relates to methods of determining a functional allele  
XX CC profile of a gene in a population. Functional allele profiles comprise  
XX CC the commonly occurring alleles in a population, and the relative  
XX CC frequencies at which such alleles of a given gene occur. The methods are  
XX CC used to identify and determine the frequency of the functional alleles of  
XX CC genes which display extensive allelic heterogeneity, particularly those  
XX CC implicated in disease or conditions, such as the BRCA1 gene associated  
XX CC with breast cancer, CPTN associated with cystic fibrosis, dystrophin  
XX CC associated with Duchenne muscular dystrophy and Becker muscular  
XX CC dystrophy, and p53 associated with Li-Fraumeni syndrome. The methods can  
XX CC also be employed for diseases where allelic and genetic heterogeneity  
XX CC exist, such as breast cancer, neurofibromatosis, and hereditary non-  
XX CC polyposis colorectal cancer. Identification of functional alleles is  
XX CC necessary for identification of mutations which may be implicated in the  
XX CC disease. Sequences AAX32001-172 represent primers for determining the  
XX CC functional allele profiles of various genes. The primers are specific for  
XX CC genes such as MSH2 gene, MLH1 gene, BRCA1 gene, BRCA2 gene and BAP1 gene

New antisense oligonucleotides targeted to nucleic acid molecules encoding human Talin, useful for inhibiting the expression of human Talin and for treating a human having a disease or condition associated with Talin.

Example 15; SEQ ID NO 10; 114pp; English.

Sequences ADG90460-ADG90539 represent phosphorothioate targeted to the human talin gene, which inhibit its expression. The antisense were designed to target different regions of human talin RNA, and were analysed for their effect on talin expression by quantitative real-time PCR. Talin is a cytoplasmic protein which links cytoskeletal proteins such as actin, myosin and vinculin to integrins, thereby linking the extracellular matrix to other cells. It is thought to be involved in the regulation of cellular adhesion and cell morphology. Talin is highly expressed in platelets, and may play a role in platelet adhesion as its subcellular distribution differs between resting non-adhesive platelets and activated adhesive platelets. It could also play a major role in determining muscle strength and cardiac function as it has been found to participate in the transmission of contractile force to the extracellular matrix in cardiomyocytes, and exhibits mechanical loading-dependent expression at myotendinous junctions. The expression of talin is downregulated by androgens in prostate tissues, a phenomenon known to contribute to the development of prostate cancer. The oligonucleotides of the invention are useful for diagnosis, prevention and treatment of talin-related disorders, such as those related to cellular adhesion. The present sequence represents a human c-Ha-ras phosphorothioate antisense oligonucleotide used as a positive control in determining optimal oligonucleotide concentration for a particular cell line.

PT Determining a functional allele profile of a gene in a population by identifying the nucleotide sequence of a gene of genomic DNA from each of the individuals with a family history of functional alleles of the gene of interest.

XX  
PS Example 1; Page 9; 28pp; English.

XX  
CC The present invention relates to a method for determining a functional allele profile of a gene in a population. The method comprises identifying the nucleotide sequence of a gene of interest out of genomic DNA from each of a population of individuals identified as having a family history which indicates inheritance of functional alleles of the gene of interest, and rank ordering the frequency of occurrence of each haplotype, where the identity of the alleles containing each haplotype and the determination of their relative frequencies constitutes the functional allele profile of the gene of interest in the population. The method is useful for determining functional allele profiles which are useful in the treatment and diagnosis of diseases, for genetic and pharmacogenetic applications, and for evaluating the degree to which the gene(s) are under selective pressure. The present sequence represents a PCR primer used in the method of the invention.

PS Claim 15; SEQ ID NO 1312; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiqunone. A composition of the invention
CC has antiinflammatory, antiallergic, antisthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiqunone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.

XX Pharmaceutical composition for treating asthma, has antisense  
PT oligonucleotide containing less percentage of adenosine, targeted to  
PT nucleic acids associated with lung airway or lung dysfunction, and  
PT bronchodilating agent.  
XX  
XX Claim 15; SEQ ID NO 4420; 763pp; English.  
PS  
XX This invention describes a novel composition (a) a first active agent,  
CC comprising oligonucleotides, effective for alleviating  
CC bronchoconstriction, respiratory tract inflammation, allergies and  
CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,  
CC surfactant depletion or hyposecretion, when administered to a mammal. The  
CC oligonucleotides are derived from a gene encoding or regulating  
CC expression of a target polypeptide associated with lung airway or lung  
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
CC The invention also describes a kit, that comprises: (a) a delivery  
CC device, in separate containers, (b) the oligonucleotides, (c)  
CC instructions for adding a carrier and for use of the kit. The composition  
CC of the invention has antiallergic, antiinflammatory, antiasthmatic,  
CC analgesic, hypotensive, immunosuppressive and cytosstatic activity, is a  
CC beta-adrenergic agonist. The composition is useful for preventing or  
CC treating a respiratory, lung or malignant disease. The administered  
CC composition comprises oligo and is administered to reduce the production  
CC or availability, or to increase the degradation of the target mRNA or to  
CC reduce the amount of target polypeptide present in the lungs. The  
CC pulmonary obstruction, and/or bronchoconstriction and/or lung  
CC inflammation, allergies and/or surfactant hypoproduction are associated  
CC with a disease or condition such as pulmonary vasoconstriction,  
CC inflammation, allergies, asthma, impeded respiration, respiratory  
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary  
CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary  
CC transplantation rejection, pulmonary infections, bronchitis or cancer.  
CC The reduced adenosine content of the anti-sense oligos corresponding to  
CC thymidines present in the target RNA serves to prevent the breakdown of  
CC the oligonucleotides into products that free adenosine into the system  
CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to  
CC prevent any unwanted effects due to it

XX Pharmaceutical composition for treating asthma, has antisense  
 PT oligonucleotide containing less percentage of adenosine, targeted to

PT nucleic acids associated with lung airway or lung dysfunction, and  
 XX bronchodilating agent.  
 PS Claim 15; SEQ ID NO 4835; 763pp; English.  
 XX This invention describes a novel composition (a) a first active agent,  
 CC comprising oligonucleotides, effective for alleviating  
 CC bronchoconstriction, respiratory tract inflammation, allergies and  
 CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,  
 CC surfactant depletion or hyposecretion, when administered to a mammal. The  
 CC oligonucleotides are derived from a gene encoding or regulating  
 CC expression of a target polypeptide associated with lung airway or lung  
 CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
 CC The invention also describes a kit, that comprises: (a) a delivery  
 CC device, in separate containers, (b) the oligonucleotides, (c)  
 CC instructions for adding a carrier and for use of the kit. The composition  
 CC of the invention has anti-allergic, anti-inflammatory, antiasthmatic, is a  
 CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a  
 CC beta-adrenergic agonist. The composition is useful for preventing or  
 CC treating a respiratory, lung or malignant disease. The administered  
 CC composition comprises oligo and is administered to reduce the production  
 CC or availability, or to increase the degradation of the target mRNA or to  
 CC reduce the amount of target polypeptide present in the lungs. The  
 CC pulmonary obstruction, and/or bronchoconstriction and/or lung  
 CC inflammation, allergies and/or surfactant hypoproduction are associated  
 CC with a disease or condition such as pulmonary vasoconstriction,  
 CC inflammation, allergies, asthma, impeded respiration, respiratory  
 CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary  
 CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary  
 CC transplantation rejection, pulmonary infections, bronchitis or cancer.  
 CC The reduced adenosine content of the anti-sense oligos corresponding to  
 CC thymidines present in the target RNA serves to prevent the breakdown of  
 CC the oligonucleotides into products that free adenosine into the system  
 CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to  
 CC prevent any unwanted effects due to it

 XX New compounds, particularly antisense oligonucleotides targeted to a  
 PT nucleic acid encoding TGF-beta 2, useful for treating cancer, a  
 PT neurodegenerative disorder, or a disease involving hyperactivation of  
 PT immune response.  
 XX Example 16; SEQ ID NO 177; 135pp; English.  
 XX The invention relates to a novel antisense compound of 8-80 nucleobases  
 CC in length targeted to, and which specifically hybridizes with, a nucleic  
 CC acid molecule encoding transforming growth factor (TGF)-beta 2, and  
 CC inhibits the expression of TGF-beta 2. The invention further relates to:  
 CC a compound 8-80 nucleobases in length that specifically hybridizes with  
 CC at least an 8-nucleobase portion of an active site on a nucleic acid  
 CC molecule encoding TGF-beta 2; a composition comprising the compound and a  
 CC carrier or diluent; inhibiting the expression of TGF-beta 2 in cells or  
 CC tissues by contacting the cells or tissues with the compound so that  
 CC expression of TGF-beta 2 is inhibited; treating an animal having a  
 CC disease or condition associated with TGF-beta 2 by administering to the  
 CC animal a therapeutic or prophylactic amount of the compound so that  
 CC expression of TGF-beta 2 is inhibited; and screening an antisense  
 CC compound. The antisense compound has cytostatic, neurotropic,  
 CC neuroprotective, and immunosuppressive activities. The compound,  
 CC composition and methods are useful for treating a disease or condition  
 CC associated with TGF-beta 2, such as a hyperproliferative disorder e.g.  
 CC cancer, a neurodegenerative disorder, or a disease or condition involving  
 CC hyperactivation of an immune response. This polynucleotide sequence  
 CC represents a preferred target DNA region of TGF-beta 2 of the invention.

CC The present invention relates to an antisense compound targeted to a  
CC nucleic acid molecule encoding Nav1.3, where the antisense compound  
CC specifically hybridizes with and inhibits the expression of Nav1.3. The  
CC compound and composition are useful for treating a disease or condition  
CC associated with Nav1.3, e.g. pain including but not limited to  
CC neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain,  
CC diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain,  
CC pain from burns, migraine headache, cluster headache, mild-to-moderate  
CC headache, seizure disorder such as childhood seizure disorder, including  
CC but not limited to neonatal or infantile epilepsy; or ataxia. The present  
CC sequence represents a chimeric phosphorothioate oligonucleotide with  
CC 2' MOE wings and a deoxy gap. Used during the antisense inhibition of  
CC human Nav1.3 expression, the oligonucleotides are designed to target  
CC different regions of the human Nav1.3 RNA.

 DR Novel single or multiple target oligonucleotide anti-sense to e.g.  
 PT initiation codon, intron of respiratory disease-relevant gene e.g. CCR1,  
 PT RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g.  
 PT asthma.

XX  
PS Claim 2; SEQ ID NO 716; 174pp; English.  
XX  
CC The invention relates to oligonucleotides anti-sense to an initiation  
CC codon, coding region, 5' or 3' intron-exon junction, intron or region  
CC with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target  
CC chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL)  
CC -5 receptor, CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM,  
CC triptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention  
CC also relates to a method of screening a candidate compound that binds to  
CC one or more nucleic acid target(s) or expressed product(s), for the  
CC prevention and/or treatment of a respiratory or lung disease. The  
CC oligonucleotides are useful for reducing or inhibiting expression of a  
CC gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor,  
CC CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, triptase a,  
CC triptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are  
CC useful for preventing or treating a respiratory or lung disease. The  
CC respiratory or lung disease is associated with hyper-responsiveness to  
CC receptor(s), and/or asthma and/or lung allergies associated with  
CC inflammation or an inflammatory disease. The respiratory or lung disease  
CC is chosen from airway inflammation, allergy, asthma, impeded respiration,  
CC cystic fibrosis (CF), chronic obstructive pulmonary disease (COPD),  
CC allergic rhinitis, acute respiratory distress syndrome, pulmonary  
CC hypertension, lung inflammation, bronchitis, airway obstruction or  
CC bronchoconstriction. This sequence represents an oligonucleotide of the  
CC invention.

XX New compounds, particularly antisense oligonucleotides targeted to a  
XX nucleic acid encoding talin, useful for treating muscular, cardiac,  
XX hematologic, or hyperproliferative disorders.  
PT  
XX Example 15; SEQ ID NO 10; 48pp; English.  
PS  
XX The invention relates to novel antisense compounds targeted to a nucleic  
XX acid molecule encoding human Talin to and inhibit its expression. The  
XX invention is useful for treating a disease or condition associated with  
XX talin such as a disease or condition e.g. muscular, haematologic, cardiac  
XX or hyperproliferative disorder such as cancer. The present sequence is an  
XX antisense oligonucleotide targeted to human Talin DNA.

XX Claim 4; SEQ ID NO 369; 226pp; English.  
PS The invention comprises antisense oligonucleotides that are targeted to  
CC the nucleic acids encoding a family of human proteins from mitochondrial  
CC membranes, which bind insulin sensitising, antidiabetic  
CC thiazolidinediones (referred to as: mitONEET). The antisense  
CC oligonucleotides of the invention are useful for modulating mitONEET  
CC expression and for treating diseases or conditions associated with  
CC mitONEET, such as: diabetes, immunological disorders, cardiovascular  
CC disorders including hypertension, neurological disorders, and  
CC ischaemia/reperfusion injuries. The present DNA sequence represents a  
CC mitONEET-specific antisense oligonucleotide of the invention. NOTE: The  
CC present sequence is a 2'-methoxyethyl (2'-MOE) gapmer with a  
CC phosphorothioate backbone.

PS Claim 6; Page 56; 74pp; English.
XX
CC The antisense oligonucleotides are useful in the treatment of tumours in
CC which expression of TGF-beta is of relevance for pathogenicity and/or
CC inhibition of pathological angiogenesis. They are used especially for the
CC treatment of the immunosuppressive effect of TGF-beta, augmentation of
CC the proliferation of cytotoxic lymphocytes, treatment of endogenous
CC hyperexpression of TGF-beta, treatment of breast tumours, neurofibromas
CC and malignant gliomas, including glioblastomas, treatment and prophylaxis
CC of skin carcinogenesis, and treatment of oesophageal and gastric
CC carcinomas. See AAQ78352-Q78488. The sequences given in GENESQ files
CC AAQ78352-Q78407 and AAQ78488 are antisense oligodeoxynucleotides of TGF-
CC beta 1. The sequences given in GENESQ files AAQ78408-78487 are antisense
CC oligodeoxynucleotides of TGF-beta 2 in the form of phosphorothioate
CC analogues. (Updated on 25-MAR-2003 to correct PN field.)

 XX Preparation of antisense oligo:nucleotide(s) which lack long runs of consecutive guanosine or inosine - and have specific ratio of residues able to form two or three hydrogen bonds, have greater activity and reduced toxicity, used therapeutically or to modulate growth of cells in culture.  
 XX Claim 10; Fig 8a; 286pp; English.  
 XX AAV48930-49007 represent antisense oligonucleotides directed against

CC transforming growth factor-beta2 (TGF-beta2). Of these, only  
 CC oligonucleotides AAV49930-67 resulted in significant reduction in TGF-  
 CC beta 2 protein expression, while oligonucleotides AAV49968-49007 had  
 CC little effect. The oligonucleotides exemplify the invention. The  
 CC specification describes oligonucleotides that contain 8-30 nucleotides,  
 CC which contain at most 8 nucleotides that can each form three hydrogen  
 CC bonds to cytosine; do not contain four consecutive nucleotides able to  
 CC form three H-bonds each to four consecutive cytosines; do not contain two  
 CC sequences of three consecutive nucleotides each able to form three H-  
 CC bonds to three consecutive cytosines, and the ratio between residues able  
 CC to form two H-bonds each (2R) or three such bonds (3R) is given by 2R/3R  
 CC = 0.33-0.72. The oligonucleotides are used to modulate expression of  
 CC genes, particularly the genes for p53, Erb-2, junB, junD, TGF-beta 1 or  
 CC beta 2 to control proliferation of primary cell cultures (e.g. bone  
 CC marrow stem, liver or kidney cells, osteoclasts, osteoblasts and/or  
 CC keratinocytes). The oligonucleotides can also be used to analyse function  
 CC of proteins (by altering their expression or activity) and  
 CC therapeutically, e.g. in cases of cancer or (targeting TGF) for  
 CC stimulating the immune system

XX Composition containing immune stimulant and inhibitor of agent that  
 PT adversely affects the immune response, for treating cancers and  
 PT infections.

XX Claim 5; Fig 1; 30pp; English.

XX This sequence is an immunosuppressant inhibitor oligonucleotide, which is  
 CC used in the invention. The invention relates to a composition which

CC contains at least one inhibitor (less than 100 kD) of a substance (e.g.  
 CC transforming growth factor TGF-beta, vascular endothelial growth factor  
 CC VEGF, interleukin-10 IL-10, prostaglandin E2 PGE2, or their receptors)  
 CC that adversely affects the immune response. The composition also includes  
 CC at least one stimulant that positively affects the immune response. This  
 CC oligonucleotide is an example of an inhibitor that is used in the  
 CC composition. The composition is used as an immunostimulant for the  
 CC treatment of neoplasms and infections, particularly hyperproliferation;  
 CC leukaemia; (non-)Hodgkin's lymphoma; carcinoma (of oesophagus, bronchi,  
 CC colon-rectum, stomach, intestine, gall bladder or duct, pancreas, anus,  
 CC breast, ovary, cervix, endometrium, prostate or bladder), liver tumours,  
 CC malignant melanoma, brain tumours and sarcomas. The oligonucleotides,  
 CC most of which are directed against TGFbeta or VEGF, are inhibitors of  
 CC monocyte chemotactic protein-1 (MCP-1) and are useful as anti-  
 CC inflammatory for treating e.g. asthma, Crohn's disease, ulcerative  
 CC colitis, diabetes, glomerulonephritis, acute respiratory distress  
 CC syndrome and the formation of atherosclerotic plaque

 PT Antisense oligonucleotides against thioredoxin and thioredoxin reductase  
 PT genes, useful for inhibiting tumor growth and metastasis.  
 XX  
 PS Claim 1; Page 18; 88pp; English.  
 XX  
 CC This invention describes novel antisense oligonucleotides against  
 CC thioredoxin and thioredoxin reductase gene which have cytostatic activity  
 CC and are useful for inhibiting tumour growth and metastasis in mammals.  
 CC They may also be used as hybridization probes to detect the presence of  
 CC the thioredoxin and thioredoxin reductase mRNAs in mammalian cells. They  
 CC may also be used as molecular weight markers. The antisense  
 CC oligonucleotides are nuclease resistant due to the presence of  
 CC phosphorothioate internucleotide linkages. AAZ00478-Z00503 represent  
 CC oligonucleotide primers capable of binding to human thioredoxin mRNA

XX
PT Novel enzymatic nucleic acid that down-regulates expression of neurite
PT growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or
PT protein kinase PKR genes, for treating cancer and inflammatory disease.
XX
PS Claim 59; SEQ ID NO 2943; 317pp; English.
XX
CC The invention comprises nucleic acids (e.g. antisense oligonucleotides)
CC that down regulate the expression or inhibit the function of a receptor
CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
CC IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
CC invention are useful for treating: cerebrovascular accident, central
CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
CC ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
CC nucleic acids of the invention are also useful for down-regulating the
CC expression of a target gene and as a diagnostic tool to examine genetic
CC drifts and mutations within diseased cells or to detect the presence of a
CC target RNA in a cell. The present RNA sequence represents a human PKR
CC substrate sequence.

 PT Determination of oligo-nucleotide with specific activity for target bio-  
 PT molecule - using set of randomised oligo-nucleotide(s).  
 XX  
 PS Disclosure; Col 27-28; 22pp; English.  
 XX  
 CC The present sequence was used in the development of a method of  
 CC determining an oligonucleotide having specific activity for a target  
 CC biomolecule. The method comprises assaying a set of randomised  
 CC oligonucleotides for activity against a target biomolecule, separating  
 CC active from inactive oligonucleotides and recovering, amplifying and  
 CC determining the nucleic acid sequence of the active oligonucleotides. The  
 CC oligonucleotides can be used for therapeutic, diagnostic and research  
 CC purposes

 PT Assay for a chemical or drug in a sample comprises detecting binding of  
 PT an oligonucleotide selected from a set of randomized oligonucleotides.  
 XX  
 PS Disclosure; Col 27-28; 20pp; English.  
 XX  
 CC This invention describes a novel method (I) for specifically detecting a  
 CC chemical or drug in a sample comprises contacting the sample with an  
 CC oligonucleotide having specific activity for a target biomolecule and

CC detecting the presence or absence of binding where the presence of  
 CC binding indicates the presence of the chemical or drug in the sample. The  
 CC oligonucleotide is identified by: (a) assaying a prepared set of  
 CC randomized oligonucleotides for activity against a target biomolecule;  
 CC (b) separating active from inactive oligonucleotides; (c) recovering the  
 CC active oligonucleotides; and (d) characterizing the recovered  
 CC oligonucleotides by microanalytical structure determination. The method  
 CC can be used for diagnostic or research purposes

XX New anti-proliferative substance comprising a radiolabeled DNA carrier,  
 PT useful for preventing or treating uncontrolled cellular proliferation  
 PT e.g. restenosis, cancer or malignant tumors.  
 XX  
 XX Claim 13; SEQ ID NO 9; 28pp; English.

CC The invention relates to an anti-proliferative substance for preventing  
 CC uncontrolled cellular proliferation comprising a radiolabelled DNA  
 CC carrier, where a radioisotope is located internally within the DNA  
 CC sequence, at 5' end or at 3' end, and the radiolabelled DNA carrier  
 CC penetrates the cell membrane and is retained intracellularly for a time  
 CC sufficient for the radio-isotope to effect a dose therapy. The carrier in  
 CC the anti-proliferative substance is an oligonucleotide, which is linear  
 CC or a plasmid, which is circular. The plasmid is of viral or bacterial  
 CC origin. The oligonucleotide is a double- or a single-stranded DNA  
 CC sequence, which is conjugated with an antibody for cell-specific

CC delivery. The oligonucleotide is also conjugated to a stent surface,  
 CC cholesterol, oleic acid, linoleic acid, IgGalpha, antibody, IgGbeta,  
 CC cytokines or growth factors. The anti-proliferative substance is useful  
 CC for preventing or treating uncontrolled cellular proliferation. The  
 CC uncontrolled cell proliferation is a restenosis following angioplasty, or  
 CC cancer or a malignant tumour. The present sequence represents an  
 CC oligonucleotide carrier used in the invention.

XX New internal transcribed spacer DNA from fungal pathogens, used as  
 PT sources of primers and probes for pathogen detection.  
 XX  
 PS Claim 13; Page 18; 40pp; English.

XX This primer can be used in the amplification-based detection of a fungal  
 CC internal transcribed spacer (ITS) DNA sequence. This sequence was derived  
 CC from the ITS sequences, specifically from the regions of the ITS which  
 CC exhibit the greatest difference among the fungal pathotypes. This allows  
 CC the identification of specific pathogens and provides a method for  
 CC detecting them

PT diagnosis of cancer , downregulates expression of the insulin-like growth
PT factor-1 receptor gene.
XX
XX Example 3; SEQ ID NO 511; 147pp; English.
XX
XX The invention relates to short interfering nucleic acids (siNA) which
CC downregulate expression of the human insulin-like growth factor 1
CC receptor (IGF-1R) gene by RNA interference. The siNAs may or may not
CC comprise ribonucleotides and may be double or single stranded. They
CC further comprise sense and antisense regions, or alternatively are
CC assembled from a sense oligonucleotide and an antisense oligonucleotide.
CC Specifically, the siNAs include short interfering RNA (siRNA), double-
CC stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs
CC can be unmodified or chemically modified, can contain
CC deoxyribonucleotides, and can be chemically synthesised, expressed from a
CC vector or enzymatically synthesised. The invention also relates to kits
CC for the in vitro or in vivo delivery of siNA; conjugates and/or complexes
CC of siNA; and vectors that express siNA. The siNAs are used to modulate
CC expression of the IGF-1R gene in cells, tissue explants or organisms
CC (e.g., by ex vivo gene therapy), or in grafts and transplants for the
CC treatment of a variety of conditions. They may be used for treating
CC cancer and other proliferative diseases (e.g., restenosis and polycystic
CC kidney disease), inflammatory and/or allergic diseases, autoimmune
CC diseases and transplant rejection. The siNAs are also useful for drug
CC screening, diagnosis, therapeutic target identification and validation,
CC genetic engineering, pharmacogenomics, studying gene function, and gene
CC mapping (e.g., of single nucleotide polymorphisms). The present sequence
CC represents the lower strand of a human IGF-1R-targeted double-stranded
CC siNA.

XX Pharmaceutical composition for treating asthma, has antisense  
XX oligonucleotide containing less percentage of adenosine, targeted to  
XX nucleic acids associated with lung airway or lung dysfunction, and  
XX bronchodilating agent.

XX Claim 15; SEQ ID NO 3936; 763pp; English.

XX This invention describes a novel composition (a) a first active agent,  
XX comprising oligonucleotides, effective for alleviating  
XX bronchoconstriction, respiratory tract inflammation, allergies and  
XX reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,  
XX surfactant depletion or hyposecretion, when administered to a mammal. The  
XX oligonucleotides are derived from a gene encoding or regulating

CC expression of a target polypeptide associated with lung airway or lung  
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
CC The invention also describes a kit, that comprises: (a) a delivery  
CC device, in separate containers, (b) the oligonucleotides, (c)  
CC instructions for adding a carrier and for use of the kit. The composition  
CC of the invention has anti-allergic, anti-inflammatory, antiasthmatic,  
CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a  
CC beta-adrenergic agonist. The composition is useful for preventing or  
CC treating a respiratory, lung or malignant disease. The administered  
CC composition comprises oligo and is administered to reduce the production  
CC or availability, or to increase the degradation of the target mRNA or to  
CC reduce the amount of target polypeptide present in the lungs. The  
CC pulmonary obstruction, and/or bronchoconstriction and/or lung  
CC inflammation, allergies and/or surfactant hypoproduction are associated  
CC with a disease or condition such as pulmonary vasoconstriction,  
CC inflammation, allergies, asthma, impeded respiration, respiratory  
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary  
CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary  
CC transplantation rejection, pulmonary infections, bronchitis or cancer.  
CC The reduced adenosine content of the anti-sense oligos corresponding to  
CC thymidines present in the target RNA serves to prevent the breakdown of  
CC the oligonucleotides into products that free adenosine into the system  
CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to  
CC prevent any unwanted effects due to it

 PT Mammalian purinergic receptor (P2X<sub>7</sub>) useful for screening for modulators  
 PT which are useful for treating arthritic, respiratory disorders and  
 PT neurodegenerative disorders, and to generate receptors specific  
 PT antibodies.  
 PS  
 SS Example 1; Col 8; 40pp; English.  
 CC  
 CC The present invention relates to rat and human purinergic receptor  
 CC P2X<sub>7</sub>/P2Z (AAC63692-C63694). The P2X<sub>7</sub> coding sequences can be used to  
 CC treat disorders of the nervous system, particularly diseases with a  
 CC component of chronic inflammation, such as Alzheimer's disease, diseases  
 CC involving acute or chronic inflammation such as rheumatoid arthritis,  
 CC amyloidosis, bacterial, viral and other microbial infections, disorders  
 CC of the haematopoietic system and immune response such as autoimmune  
 CC disorders, allergies and lymphoproliferative disorders, diseases  
 CC involving apoptotic cell death, such as cardiac and cerebral ischaemia  
 CC and microbial infections, particularly tuberculosis. The present sequence  
 CC is a PCR primer used to isolate the rat P2X<sub>7</sub> coding sequence

 PT Screening of compound for its ability to modulate permeabilizing activity  
 PT of mammalian receptor useful for treating e.g. arthritis, and alzheimer's  
 PT disease.  
 PS  
 PS Example 1; SEQ ID NO 4; 43pp; English.  
 XX  
 CC The invention discloses a method for screening a compound for its ability  
 CC to modulate the permeabilizing activity of a mammalian P2X7 (P2Z)  
 CC receptor. The P2Z receptor is a cell surface receptor for ATP and has  
 CC been implicated in the lysis of antigen presenting cells by cytotoxic T  
 CC lymphocytes, in the mitogenic stimulation of human T lymphocytes, as well  
 CC as in the formation of multinucleated giant cells. The preferred agonist  
 CC is adenosine triphosphate (ATP) or 3'-O-(4-benzoyl)benzoyl ATP (BzATP)  
 CC and the preferred method comprises monitoring the uptake into the cell of  
 CC a detectable molecule, preferably a fluorescent dye (e.g. propidium

CC iodide). The inventive method is useful for screening a compound for its  
 CC ability to modulate the permeabilizing activity of a mammalian P2X7  
 CC receptor useful for treatment of arthritic and respiratory disorders and  
 CC neurodegenerative diseases. It is particularly useful in the treatment of  
 CC Alzheimer's disease, diseases involving acute or chronic inflammation  
 CC including rheumatoid arthritis, amyloidosis, bacterial, viral and other  
 CC microbial infections, e.g. tuberculosis, disorders of the haematopoietic  
 CC system and immune response, including autoimmune disorders, allergies and  
 CC lymphoproliferative disorders, diseases involving apoptotic cell death,  
 CC such as cardiac and cerebral ischaemia. The sequence presented is a  
 CC nested PCR primer used for the amplification of rat P2X7 cDNA.

XX Claim 15; SEQ ID NO 4055; 763pp; English.

PS

XX This invention describes a novel composition (a) a first active agent,  
 CC comprising oligonucleotides, effective for alleviating  
 CC bronchoconstriction, respiratory tract inflammation, allergies and  
 CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,  
 CC surfactant depletion or hyposecretion, when administered to a mammal. The  
 CC oligonucleotides are derived from a gene encoding or regulating  
 CC expression of a target polypeptide associated with lung airway or lung

CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
 CC The invention also describes a kit, that comprises: (a) a delivery  
 CC device, in separate containers, (b) the oligonucleotides, (c)  
 CC instructions for adding a carrier and for use of the kit. The composition  
 CC of the invention has antiallergic, antiinflammatory, antiasthmatic,  
 CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a  
 CC beta-adrenergic agonist. The composition is useful for preventing or  
 CC treating a respiratory, lung or malignant disease. The administered  
 CC composition comprises oligo and is administered to reduce the production  
 CC or availability, or to increase the degradation of the target mRNA or to  
 CC reduce the amount of target polypeptide present in the lungs. The  
 CC pulmonary obstruction, and/or bronchoconstriction and/or lung  
 CC inflammation, allergies and/or surfactant hypoproduction are associated  
 CC with a disease or condition such as pulmonary vasoconstriction,  
 CC inflammation, allergies, asthma, impeded respiration, respiratory  
 CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary  
 CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary  
 CC transplantation rejection, pulmonary infections, bronchitis or cancer.  
 CC The reduced adenosine content of the anti-sense oligos corresponding to  
 CC thymidines present in the target RNA serves to prevent the breakdown of  
 CC the oligonucleotides into products that free adenosine into the system  
 CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to  
 CC prevent any unwanted effects due to it

 XX Novel single or multiple target oligonucleotide anti-sense to e.g.  
 XX initiation codons and introns of respiratory disease-relevant genes e.g.,  
 XX CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory  
 XX disease e.g., asthma.  
 XX  
 XX Claim 2; SEQ ID NO 876; 85pp; English.  
 XX  
 XX The present invention relates to an oligonucleotide anti-sense to e.g.,  
 XX initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-  
 XX end of nucleic acid target comprising gene(s) chosen from e.g.  
 XX interleukin (IL)-4 receptor, IL-5 receptor or salts of the  
 XX oligonucleotide and optionally surfactant operatively linked to the  
 XX oligonucleotide. The method is useful for preventing or treating a  
 XX respiratory or lung disease, which involves administering to the airways  
 XX of a subject an effective amount of an inhibitor. The oligonucleotide is  
 XX useful for production of a medicament for the prevention and/or treatment  
 XX of a respiratory or lung disease. The respiratory or lung disease is  
 XX chosen from airway inflammation, allergy(ies), asthma, impeded  
 XX respiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases  
 XX (COPD), allergic rhinitis (AR), acute respiratory distress syndrome  
 XX (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway  
 XX obstruction. The present sequence represents an oligonucleotide of the  
 XX invention.

 XX Novel single or multiple target oligonucleotide anti-sense to e.g.  
 XX initiation codon, intron of respiratory disease-relevant gene e.g. CCR1,  
 XX RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g.  
 XX asthma.  
 XX Claim 2; SEQ ID NO 876; 174pp; English.  
 XX The invention relates to oligonucleotides anti-sense to an initiation  
 XX codon, coding region, 5' or 3' intron-exon junction, intron or region  
 XX with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target  
 XX chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL)  
 XX -5 receptor, CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM,  
 XX tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention  
 XX also relates to a method of screening a candidate compound that binds to  
 XX one or more nucleic acid target(s) or expressed product(s), for the  
 XX prevention and/or treatment of a respiratory or lung disease. The  
 XX oligonucleotides are useful for reducing or inhibiting expression of a  
 XX gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor,  
 XX CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a,  
 XX tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are  
 XX useful for preventing or treating a respiratory or lung disease. The  
 XX respiratory or lung disease is associated with hyper-responsiveness to  
 XX and/or increased levels of, adenosine and/or levels of adenosine A  
 XX receptor(s), and/or asthma and/or lung allergies associated with  
 XX inflammation or an inflammatory disease. The respiratory or lung disease  
 XX is chosen from airway inflammation, allergy, asthma, impeded respiration,  
 XX cystic fibrosis (CF), chronic obstructive pulmonary disease (COPD),  
 XX allergic rhinitis, acute respiratory distress syndrome, pulmonary  
 XX hypertension, lung inflammation, bronchitis, airway obstruction or  
 XX bronchoconstriction. This sequence represents an oligonucleotide of the  
 XX invention.

| XX         | New nucleoside analogs for producing oligonucleotide analogs useful e.g.  |
| PT         | as antisense compounds.   |
| PS         | Example 2; Page 48; 74pp; Japanese.                                       |
| CC         | The invention relates to nucleoside analogues and their salts. The        |
| CC         | invention also encompasses oligonucleotides and their salts comprising at |
| CC         | least one nucleoside analogue of the invention. The nucleoside analogues  |
| CC         | are produced by reducing an nucleoside azide derivative and optionally    |
| CC         | further interconverting, or by reacting a nucleoside derivative with      |
| CC         | formaldehyde and optionally deprotecting and/or interconverting. The      |
| CC         | nucleoside analogues can be used for producing oligonucleotides useful as |
| CC         | antisense compounds and in antigenic methods. The present sequence        |
| CC         | represents a hairpin oligonucleotide used in an example of the invention. |

XX  
XX Preparation of antisense oligonucleotide(s) which lack long runs of  
XX consecutive guanosine or inosine - and have specific ratio of residues  
XX able to form two or three hydrogen bonds, have greater activity and  
XX reduced toxicity, used therapeutically or to modulate growth of cells in  
XX culture.  
XX  
XX Claim 10; Fig 8a; 286pp; English.  
XX  
XX AA48930-49007 represent antisense oligonucleotides directed against  
XX transforming growth factor-beta2 (TGF-beta2). Of these, only  
XX oligonucleotides AA48930-67 resulted in significant reduction in TGF-  
XX beta 2 protein expression, while oligonucleotides AA48968-49007 had  
XX little effect. The oligonucleotides exemplify the invention. The  
XX specification describes oligonucleotides that contain 8-30 nucleotides,  
XX which contain at most 8 nucleotides that can each form three hydrogen  
XX bonds to cytosine; do not contain four consecutive nucleotides able to  
XX form three H-bonds each to four consecutive cytosines; do not contain two  
XX sequences of three consecutive nucleotides each able to form three H-  
XX bonds to three consecutive cytosines, and the ratio between residues able  
XX to form two H-bonds each (2R) or three such bonds (3R) is given by 2R/3R  
XX = 0.33-0.72. The oligonucleotides are used to modulate expression of  
XX genes, particularly the genes for p53, ErbB-2, junB, junD, TGF-beta 1 or  
XX beta 2 to control proliferation of primary cell cultures (e.g. bone  
XX marrow stem, liver or kidney cells, osteoclasts, osteoblasts and/or  
XX keratinocytes). The oligonucleotides can also be used to analyse function  
XX of proteins (by altering their expression or activity) and  
XX therapeutically, e.g. in cases of cancer or (targeting TGF) for  
XX stimulating the immune system

XX Composition containing immune stimulant and inhibitor of agent that  
XX adversely affects the immune response, for treating cancers and  
XX infections.  
XX  
XX Claim 5; Fig 1; 30pp; English.

XX This sequence is an immunosuppressant inhibitor oligonucleotide, which is  
XX used in the invention. The invention relates to a composition which  
XX contains at least one inhibitor (less than 100 kD) of a substance (e.g.  
XX transforming growth factor TGF-beta, vascular endothelial growth factor  
XX VEGF, interleukin-10 IL-10, prostaglandin E2 PGE2, or their receptors)  
XX that adversely affects the immune response. The composition also includes  
XX at least one stimulant that positively affects the immune response. This  
XX oligonucleotide is an example of an inhibitor that is used in the  
XX composition. The composition is used as an immunostimulant for the  
XX treatment of neoplasms and infections, particularly hyperproliferation;  
XX leukaemia; (non-Hodgkin's lymphoma; carcinoma (of oesophagus, bronchi,  
XX colon-rectum, stomach, intestine, gall bladder or duct, pancreas, anus,  
XX breast, ovary, cervix, endometrium, prostate or bladder), liver tumours,  
XX malignant melanoma, brain tumours and sarcomas. The oligonucleotides,  
XX most of which are directed against TGFbeta or VEGF, are inhibitors of  
XX monocyte chemotactic protein-1 (MCP-1) and are useful as anti-  
XX inflammatory for treating e.g. asthma, Crohn's disease, ulcerative  
XX colitis, diabetes, glomerulonephritis, acute respiratory distress  
XX syndrome and the formation of atherosclerotic plaque

XX New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves  
XX RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1,

PT PCNA and Cyclin B1.  
 PS Disclosure; Page 108; 109pp; English.  
 XX  
 CC The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.  
 CC Representative examples of ribozyme recognition sites are given in CC AAA82415 to AAA86787. The ribozyme of the invention is useful for CC inhibiting restenosis by introduction of the ribozyme into cells. The CC ribozyme is resistant to endonuclease activity and hence is efficient in CC restenosis treatment

 PT Vaccinating against tumors, infectious diseases, allergies and asthma  
 PT using immunostimulatory Py-rich and TG nucleic acids.  
 XX  
 PS Claim 101; Page 41; 338pp; English.  
 XX  
 CC The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the present sequence may have a phosphorothioate backbone

 PT Vaccinating against tumors, infectious diseases, allergies and asthma  
 PT using immunostimulatory Py-rich and TG nucleic acids.  
 XX  
 PS Claim 101; Page 41; 338pp; English.  
 XX  
 CC The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the present sequence may have a phosphorothioate backbone

PT Treating proliferative skin or eye diseases and scarring, using ribozymes
PT that cleave RNA encoding cytokines involved in inflammation, matrix
PT metalloproteinases, growth factors and cell-cycle dependent kinases.
XX
PS Example 1; Page 367; 408pp; English.
XX
CC The present invention describes a method for treating a proliferative
CC skin or eye disease and scarring. The method involves administering a
CC ribozyme (I) which cleaves RNA encoding a cytokine involved in
CC inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle
CC dependent kinase, growth factor or a reductase, or administering a
CC nucleic acid molecule (II) comprising a promoter operably linked to a
CC nucleic acid segment encoding (I). (I) can have antipsoialtic,
CC dermatological, cytosatic, antiseborrheic, antidiabetic, antisickling,
CC ophthalmological, vulnery, keratolytic and virucide activities, and
CC cleaves RNA encoding cytokine involved in inflammation. (I) can be used
CC in gene therapy. (I) and (II) are useful for treating proliferative skin
CC diseases such as psoriasis, atopic dermatitis, actinic keratosis,
CC squamous or basal cell carcinoma and viral or seborrheic wart. They can
CC also be used for treating proliferative eye diseases such as diabetic
CC retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of
CC prematurity and retinal detachment, and for treating and preventing
CC scarring such as keloid, adhesion and hypertrophic or hypertrophic burn
CC scar. AAH57577 to AAH62099 represent sequences used in the
CC exemplification of the present invention

XX
XX Treating and/or preventing allergy or asthma using an immunostimulatory
PT nucleic acid alone or in combination with an asthma/allergy medicament.
XX
XX Disclosure; Page 7; 221pp; English.
XX
XX The invention relates to a method of treating or preventing allergy or
CC asthma which comprises administering to a subject a poly-G nucleic acid
CC in an aerosol formulation. The methods and compositions of the present
CC invention are useful for diagnosing and/or treating asthma and allergy
CC especially in a hypo-responsive subject. The present sequence represents
CC an immunostimulatory nucleic acid of the invention.

XX
XX Investigating male genetic infertility, useful for diagnosis e.g. for
PT assessing suitability for in vitro fertilization, based on multifactorial
PT analysis of infertility-related mutations.
XX
XX Claim 13; SEQ ID NO 365; 110pp; German.
XX
XX This invention describes a novel method for investigating genetic
CC
```

```
CC infertility or predisposition in males. The method involves selecting at
CC least two infertility-associated mutations which are recessive or
CC intermediate that are associated with infertility in the heterozygous
CC state and/or only in the homozygous state. Preferably at least one
CC azoospermia factor is detected which may be lost by microdeletions in
CC intervals 5 or 6 of the Y-chromosome. Also any of several hundred
CC mutations, listed, present in the cystic fibrosis transmembrane
CC conductance regulator (CFTR), Kallmann syndrome (KAL1), androgen
CC resistance (AR) or steroid 21-hydroxylase (CYP21) genes may be detected.
CC Probes for the mutated genes and/or native nucleic acid, or their
CC complementary strands, are fixed to a carrier, particularly as a
CC microarray, then tested for hybridization with oligonucleotides from or
CC synthesized from, a patient sample and hybridization detected.
CC Multifactorial analysis is by standard statistical methods, particularly
CC the quantitative trait locus method. The method is used to diagnose
CC inherited male infertility or predisposition to its, especially in
CC conjunction with in vitro fertilization programs, e.g. for assessing
CC subjects with oligospermia for possible application of the
CC intracytoplasmic sperm injection method. Analysis of many mutations
CC improves diagnosis of the genetic basis of male infertility, including
CC polygenic origins (complex interactions between different heterozygotic
CC mutations). A chip for analyzing genetic infertility in males comprises
CC oligonucleotides that represent known mutations (nonsense or missense,
CC insertions, allelic variants deletions or rearrangements) in the cystic
CC fibrosis transmembrane conductance regulator, Kallmann syndrome, androgen
CC resistance and steroid 21-hydroxylase genes. ADD42140-ADD42633 represent
CC oligonucleotides used in the microarray described in the method of the
CC invention. NOTE: there are no SEQ ID's 133, 472 or 473 represented in the
CC SEQ ID list of the specification.

CC The invention relates to short interfering nucleic acids (siNA) which  
 CC downregulate expression of the human insulin-like growth factor 1  
 CC receptor (IGF-1R) gene by RNA interference. The siNAs may or may not  
 CC comprise ribonucleotides and may be double or single stranded. They  
 CC further comprise sense and antisense regions, or alternatively are  
 CC assembled from a sense oligonucleotide and an antisense oligonucleotide.  
 CC Specifically, the siNAs include short interfering RNA (siRNA), double-

CC stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs  
 CC can be unmodified or chemically modified, can contain  
 CC deoxyribonucleotides, and can be chemically synthesised, expressed from a  
 CC vector or enzymatically synthesised. The invention also relates to kits  
 CC for the in vitro or in vivo delivery of siNA; conjugates and/or complexes  
 CC of siNA; and vectors that express siNA. The siNAs are used to modulate  
 CC expression of the IGF-1R gene in cells, tissue explants or organisms  
 CC (e.g., by ex vivo gene therapy), or in grafts and transplants for the  
 CC treatment of a variety of conditions. They may be used for treating  
 CC cancer and other proliferative diseases (e.g., restenosis and polycystic  
 CC kidney disease), inflammatory and/or allergic diseases, autoimmune  
 CC diseases and transplant rejection. The siNAs are also useful for drug  
 CC screening, diagnosis, therapeutic target identification and validation,  
 CC genetic engineering, pharmacogenomics, studying gene function, and gene  
 CC mapping (e.g., of single nucleotide polymorphisms). The present sequence  
 CC represents the lower strand of a human IGF-1R-targeted double-stranded  
 CC siNA.

 CC screening, diagnosis, therapeutic target identification and validation,  
 CC genetic engineering, pharmacogenomics, studying gene function, and gene  
 CC mapping (e.g., of single nucleotide polymorphisms). The present sequence  
 CC represents the upper strand of a human IGF-1R-targeted double-stranded  
 CC siNA, which is identical to the IGF-1R transcript target sequence.

 XX Assessing the metabolic state of a cell comprises isolating at least one

PT mRNP complex comprising at least one RNA binding protein, and at least  
PT one mRNA or at least one mRNP complex-associated protein.  
PS Example 4; SEQ ID NO 32; 86pp; English.  
XX  
CC The present invention describes a method for assessing the metabolic  
CC state of a cell. The method comprises isolating at least one mRNP complex  
CC having at least one RNA binding protein, and at least one mRNA or at  
CC least one mRNP complex-associated protein, and determining the expression  
CC level of the mRNA or mRNP complex-associated protein, where the level of  
CC expression of the at least one mRNA or the at least one mRNP complex-  
CC associated protein is indicative of the metabolic state of the cell. The  
CC method can be used for assessing the metabolic state in a cell, and for  
CC identifying and evaluating mRNA and protein targets associated with mRNP  
CC complexes and implicated in the expression of proteins involved in common  
CC physiological pathways. The present sequence represents a TGF beta 2 3'-  
CC UTR consensus sequence, which is used in an example from the present  
CC invention.

XX  
PT Enzymatic nucleic acid molecules having a hammer-head motif - used for  
PT the treatment of arthritis, induction of graft tolerance or treatment of  
PT auto-immune diseases.  
XX  
PS Example 1; Page 155; 307pp; English.  
XX  
CC The present invention describes a novel enzymatic nucleic acid (ENA)  
CC having a hammerhead motif (HM) comprising: (i) at least 5 ribose residues  
CC : (ii) a 2'-C-allyl modification at position 4 of the ENA; (iii) at least  
CC ten 2'-O-methyl modifications; and (iv) a 3'-end modification. The ENA's  
CC can inhibit collagenase and stromelysin production in the synovial  
CC membrane of joints for the treatment or prevention of arthritis,  
CC particularly osteoarthritis or rheumatoid arthritis. The ENA's can also  
CC be used to treat antigen presenting cells of a donor to induce tolerance  
CC in a recipient to an alloantigen of a donor. They can also be used for  
CC enhancing graft tolerance or for treating autoimmune disease, and for  
CC treating allergies and other inflammatory conditions. The ENA's can also  
CC be used in diagnosis. Ribozyme therapy impacts on the expression of  
CC stromelysin without introducing the non-specific effects upon gene  
CC expression which accompany treatment with retinoids and dexamethasone.  
CC The concentration of ribozyme required to affect a therapeutic treatment  
CC is lower than that required of antisense molecules, and is highly  
CC specific. The present sequence is used in the exemplification of the  
CC present invention

| XX                    |   |
| CC                    | A method has been developed for the identification of a nucleic acid      |
| CC                    | capable of modulating a process in a biological system. The method        |
| CC                    | comprises: (a) introducing into the system a random library of nucleic    |
| CC                    | acid catalysts (NAC) having a substrate binding domain (SBD), comprising  |
| CC                    | a random sequence, and a catalytic domain (CD); and (b) identifying NAC   |
| CC                    | in systems where modulation has occurred and/or determining the sequence  |
| CC                    | of at least part of the SBDs in such systems. Nucleic acid molecules with |
| CC                    | endonuclease activity and catalytic activity, from the present invention, |
| CC                    | are used to modulate gene expression in plant and mammalian cells and to  |
| CC                    | cleave target nucleic acid, particularly for treating systemic diseases   |
| CC                    | caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepatic |
| CC                    | ascites and infection. They may also be used to detect genetic drift and  |
| CC                    | mutations in diseased cells and to determine c-raf RNA. Specifically NACS |
| CC                    | with RNA-cleaving activity that modulate expression of the Raf gene, are  |
| CC                    | used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or   |
| CC                    | generally any condition associated with the level of c-raf. Introduction  |
| CC                    | of sugar/phosphate modifications increases stability against nuclease and |
| CC                    | activity. AAV90922 to AAV93877 represent NACS that can be used in the     |
| CC                    | method, specifically for modulating the expression of a Raf gene          |

XX
XX Composition containing immune stimulant and inhibitor of agent that
XX adversely affects the immune response, for treating cancers and
XX infections.
XX
XX Claim 10; Fig 1; 30pp; English.
XX
XX This sequence is an immunosuppressant inhibitor oligonucleotide, which is
XX used in the invention. The invention relates to a composition which
XX contains at least one inhibitor (less than 100 kD) of a substance (e.g.
XX transforming growth factor TGF-beta, vascular endothelial growth factor
XX VEGF, interleukin-10 IL-10, prostaglandin E2 PGE2, or their receptors)
XX that adversely affects the immune response. The composition also includes
XX at least one stimulant that positively affects the immune response. This
XX oligonucleotide is an example of an inhibitor that is used in the
XX composition. The composition is used as an immunostimulant for the
XX treatment of neoplasms and infections, particularly hyperproliferation;
XX leukaemia; (non-)Hodgkin's lymphoma; carcinoma (of oesophagus, bronchi,
XX colon-rectum, stomach, intestine, gall bladder or duct, pancreas, anus,
XX breast, ovary, cervix, endometrium, prostate or bladder), liver tumours,
XX malignant melanoma, brain tumours and sarcomas. The oligonucleotides,
XX most of which are directed against TGFbeta or VEGF, are inhibitors of
XX monocyte chemotactic protein-1 (MCP-1) and are useful as anti-
XX inflammatory for treating e.g. asthma, Crohn's disease, ulcerative
XX colitis, diabetes, glomerulonephritis, acute respiratory distress
XX syndrome and the formation of atherosclerotic plaque

XX This invention relates to novel isolated nucleic acid sequences involved  
 CC in the phenomena of tumour suppression, tumour reversion, apoptosis  
 CC and/or resistance to viruses. The invention may be useful for the  
 CC development of compounds with a cytostatic, virucide, neuroprotective,  
 CC neurotropic or neuroleptic activity. The DNA sequences may be useful as  
 CC probes and primers for detecting, identifying, quantifying and/or  
 CC amplifying nucleic acid, for example as one component of a gene chip, in  
 CC vitro as antisense reagents and for production of recombinant  
 CC polypeptides. The invention may therefore be useful for preparation of  
 CC pharmaceuticals for prevention and/or treatment of viral diseases that  
 CC are characterised by development of tumours or cell degeneration.  
 CC specifically cancer but also Alzheimer's disease and schizophrenia. The  
 CC present sequence is that of a nucleic acid sequence of the invention.  
 CC Note: The sequence data for this patent did not form part of the printed  
 CC specification, but was obtained in electronic format directly from WIPO  
 CC at ftp.wipo.int/pub/publicdpct\_sequences

 PT Novel enzymatic nucleic acid that down-regulates expression of neurite  
 PT growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or  
 PT protein kinase PKR genes, for treating cancer and inflammatory disease.  
 XX  
 PS Claim 59; SEQ ID NO 2946; 317pp; English.

XX The invention comprises nucleic acids (e.g. antisense oligonucleotides)  
 CC that down regulate the expression or inhibit the function of a receptor  
 CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),  
 CC IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the  
 CC invention are useful for treating: cerebrovascular accident, central  
 CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,  
 CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,  
 CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune  
 CC disease, lupus, multiple sclerosis, transplant/graft rejection,  
 CC ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic  
 CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The  
 CC nucleic acids of the invention are also useful for down-regulating the  
 CC expression of a target gene and as a diagnostic tool to examine genetic  
 CC drifts and mutations within diseased cells or to detect the presence of a  
 CC target RNA in a cell. The present RNA sequence represents a human PKR  
 CC substrate sequence.

 XX New transforming growth factor beta anti:sense oligo:nucleotide(s) - for  
 PT treating immunosuppression, tumours, etc.  
 XX  
 XX Claim 6; Page 56; 74pp; English.  
 PS  
 XX The antisense oligonucleotides are useful in the treatment of tumours in  
 CC which expression of TGF-beta is of relevance for pathogenicity and/or  
 CC inhibition of pathological angiogenesis. They are used especially for the  
 CC treatment of the immunosuppressive effect of TGF-beta, augmentation of  
 CC the proliferation of cytotoxic lymphocytes, treatment of endogenous

CC hyperexpression of TGF-beta, treatment of breast tumours, neurofibromas  
 CC and malignant gliomas, including glioblastomas, treatment and prophylaxis  
 CC of skin carcinogenesis, and treatment of oesophageal and gastric  
 CC carcinomas. See AAQ78352-Q78488. The sequences given in GENESSEQ files  
 CC AAQ78352-Q78407 and AAQ78488 are antisense oligodeoxynucleotides of TGF-  
 CC beta 1. The sequences given in GENESSEQ files AAQ78408-78487 are antisense  
 CC oligodeoxynucleotides of TGF-beta 2 in the form of phosphorothioate  
 CC analogues. (Updated on 25-MAR-2003 to correct PN field.)

 XX Oligonucleotide bioversible phosphate esters used as, e.g. research  
 PT agents.  
 XX  
 XX Example 5; Page 35; 61pp; English.  
 PS  
 XX The present invention describes oligonucleotides containing bioversible  
 CC phosphate ester groups and their mimetics. The oligonucleotides are of  
 CC value in therapeutics, diagnostics, and as research reagents. The  
 CC compound from the present invention may be used in control of hereditary,  
 CC metabolic, and/or cellular processes in any organism utilising DNA-RNA  
 CC transcription and/or RNA-protein translation. These organisms include  
 CC prokaryotic and eukaryotic unicellular and multicellular organisms;  
 CC including bacteria, yeasts, protozoa, algae, and all plants and higher  
 CC animal forms, including warm blooded animals, particularly humans; also  
 CC organelle sub-cellular translation and transcription processes. The new  
 CC synthetic process provides pre-oligonucleotides, i.e., oligonucleotides  
 CC blocked at phosphate groups by bioversible groups which can be cleaved  
 CC by intracellular and intercellular enzymes to generate an active or  
 CC oligonucleotide, as for prodrugs and drugs. By careful selection of

CC protecting groups, deprotection of nucleobases and partial deprotection  
 CC of phosphate linkages can be achieved in the reaction sequence. Suggested  
 CC specific groups include S-pivaloylmercaptethyl (SPME) and  
 CC cyanoethylcarbonyl (CEOC) groups. Spacer molecules include diglycolyl  
 CC (COCH<sub>2</sub>2OCH<sub>2</sub>2CO) and its analogue with a catechol bisresidue replacing the  
 CC oxygen atom (1,2-phenylenedioxy-diacetic acid). The present sequence  
 CC represents a phosphorothioate oligonucleotide used in the exemplification  
 CC of the present invention

 PT Determining the concentration of a target nucleic acid, useful e.g. for  
 PT detecting genetic mutations, comprises using a fluorescently labeled  
 PT probe in which emission is reduced by binding to the target nucleic acid.  
 XX  
 PS Example 5; Page 21; 55pp; English.  
 XX  
 CC The invention relates to the determination of the concentration of a  
 CC nucleic acid target, using a fluorescently labeled probe which produces  
 CC reduced fluorescence emission when hybridised to the target nucleic acid.  
 CC The method comprises measuring the reduction in emission caused by  
 CC hybridisation. The new method is particularly used to quantify target  
 CC nucleic acids by a real-time polymerase chain reaction, e.g. for  
 CC quantifying microbial cells in co-cultures or symbiotic systems, for  
 CC detecting gene mutations or polymorphisms, and for analysing melting  
 CC curves of target nucleic acids to determine a Tm value. Methods of the  
 CC invention allow target nucleic acids to be quantified quickly, easily and  
 CC accurately. Particularly there is no need to remove unbound probe, and no  
 CC materials are introduced that inhibit amplification by Taq polymerase (so  
 CC conventional PCR conditions can be used). The specificity of PCR is kept  
 CC high (amplification of primer dimers is delayed), and the limit of  
 CC quantitation is reduced. Complex probes are not needed, and amplification

CC can be monitored in real time. The working graph for data analysis  
 CC (automatically generated by a computer) has a higher correlation  
 CC coefficient than conventional graphs so more accurate quantitation is  
 CC possible. The current sequence represents a nucleic acid probe of the  
 CC invention that was used for investigating the base selectivity of a  
 CC target nucleic acid

XX Detecting and differentiating between hematopoietic cell proliferative

PT disorders, comprises contacting a target nucleic acid with a reagent that  
 PT distinguishes between methylated and non-methylated CpG dinucleotides.  
 XX Claim 15; Page 67; 117pp; English.

XX The present invention describes a method for detecting and  
 CC differentiating between haematopoietic cell proliferative disorders  
 CC associated with at least 1 gene and/or their regulatory regions in a  
 CC subject. The method comprises contacting a target nucleic acid in a  
 CC biological sample obtained from the subject with at least 1 reagent,  
 CC which distinguishes between methylated and non-methylated CpG  
 CC dinucleotides within the target nucleic acid. ABZ09861 to ABZ11118  
 CC represent specifically claimed nucleotide sequences from the present  
 CC invention. Oligonucleotides from the present invention can be used: for  
 CC differentiating between healthy haematopoietic cells and proliferative  
 CC disorder haematopoietic cells; for differentiating between acute  
 CC lymphocytic leukaemia and acute myelogenous leukaemia; as probes for  
 CC determining the cytosine methylation state and/or single nucleotide  
 CC polymorphisms (SNPs) of haematopoietic cell proliferation disorder  
 CC related sequences and their complements; and as primers for the

CC amplification of haematopoietic cell proliferation disorder related DNA  
 CC sequences. The nucleotide sequences from the present invention can also  
 CC be used for detecting a predisposition to, differentiation between  
 CC subclasses, diagnosis, prognosis, treatment and/or monitoring of  
 CC haematopoietic cell proliferation disorders. The present method enables a  
 CC highly specific classification of haematopoietic cell proliferative  
 CC disorders allowing for improved and informed treatment of patients

PT Vegetal sequences including single nucleotide polymorphism - useful, e.g.  
 PT to determine polymorphisms in plants, determine strain in plant breeding  
 PT and to correlate polymorphisms with phenotypic traits.

XX Example 2; Page 9; 32pp; English.

XX The present invention describes a nucleic acid segment comprising at  
 CC least 10 contiguous nucleotides from a vegetal sequence including a  
 CC polymorphic site which is a single nucleotide polymorphism (SNP), or the  
 CC complement of the segment. Also described are: (1) an allele-specific  
 CC oligonucleotides hybridizing to segment, or their complements; and (2) a  
 CC method of analysing nucleic acids from a subject, by determining if a  
 CC base is occupying any one (or a set) of polymorphic sites in 261  
 CC sequences derived from six maize lines (see AAV47701 to AAV47961). The  
 CC segments are useful in fingerprint analysis in plants to determine which  
 CC polymorphisms are present, which strain a plant belongs to and to  
 CC distinguish between strains. The polymorphisms may correlate with  
 CC phenotypic traits (e.g. plant growth rate or crop yield), and the  
 CC segments are useful to determine the presence/absence of specific  
 CC polymorphisms correlating with the existence/absence of particular  
 CC traits. The segments are also useful in marker assisted back-cross  
 CC techniques to select plants with a higher percentage of recurrent parent  
 CC in a back-cross population. Segments incorporate SNPs which occur more

CC frequently than other polymorphism types and are therefore more likely to  
 CC be located close to genetic loci of interest; different forms of  
 CC characterised SNPs are also often easier to detect than other  
 CC polymorphism types. AAV40304 to AAV40369 are used in an example from the  
 CC present invention as markers and PCR primers. (Updated on 27-AUG-2003 to  
 CC correct OS field.)

PT New transgenic potato (Solanum tuberosum) plants resistant to  
 PT lepidopteran insects comprise 5-10 copies of DNA encoding Bacillus  
 PT thuringiensis endotoxin, for reducing synthetic pesticides in protecting  
 PT potato crops.

XX Example 1; Col 5; 17pp; English.

XX A transformed potato (Solanum tuberosum) plant comprising 5-10 copies of  
 CC a DNA, which encodes a Bacillus thuringiensis endotoxin integrated into  
 CC the plant genome, has resistance to lepidopteran insects. The DNA encodes  
 CC the B. thuringiensis variety Kustaki (b.k.t.) HD-73 delta endotoxin  
 CC (represented by sequence AAA72746). The potato plants are transformed  
 CC using a vector containing the endotoxin gene fragment and neomycin  
 CC phosphotransferase II (NPT II) in a translational fusion. The transgenic  
 CC potato plants with higher endotoxin expression are more resistant to  
 CC lepidopteran insects e.g. hornworms, hence these transgenic plants are  
 CC particularly useful in reducing the amount of synthetic pesticides used  
 CC in protecting potato crops worldwide, and for producing lepidopteran  
 CC insect resistant potato varieties. The present sequence represents a PCR  
 CC primer used to amplify a fragment of the HD-73 endotoxin and NPT II  
 CC construct. The PCR product is used in the construction of the transgenic  
 CC plant of the invention

XX DE New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves
PT RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1,
PT PCNA and Cyclin B1.
XX PS Disclosure; Page 100; 109pp; English.
XX CC The present invention relates to a hairpin or hammerhead ribozyme,
CC designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase
CC other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.
CC Representative examples of ribozyme recognition sites are given in
CC AAA82415 to AAA86787. The ribozyme of the invention is useful for
CC inhibiting restenosis by introduction of the ribozyme into cells. The
CC ribozyme is resistant to endonuclease activity and hence is efficient in
CC restenosis treatment

 DR Novel biallelic markers used to construct a high density disequilibrium  
 XX map of the human genome.  
 PT  
 XX  
 PS Claim 8; Page 1216; 2745pp; English.  
 XX  
 CC AAZ65654 to AAZ69578 represent human biallelic markers from the present  
 CC invention, which contain a polymorphic base at position 24 of their  
 CC nucleotide sequences. AAZ69579 to AAZ77440 represent amplification  
 CC primers for the biallelic markers. The biallelic markers of the invention  
 CC have a variety of uses: they can be used for high density mapping of the  
 CC human genome, and in complex association studies and haplotyping studies  
 CC which are useful in determining the genetic basis for disease states.  
 CC Compositions and methods of the invention can also be useful for the  
 CC identification of the targets for the development of pharmaceutical  
 CC agents and diagnostic methods, as well as the characterisation of the  
 CC differential efficacious responses to and side effects from  
 CC pharmaceutical agents acting on a disease as well as other treatment.  
 CC N.B. The SEQ ID NOs 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and  
 CC 3367, are not actually given a sequence in the Sequence Listing from the  
 CC present invention

 XX

CC The present sequence is the antisense nucleotide to the 3'UTR region of  
 CC monkey apoptosis linked gene-2 like protein (sALG-2LP) which modulates  
 CC programmed cell death. This nucleotide when administered to a subject or  
 CC generated in situ hybridises with cellular mRNA or genomic DNA encoding  
 CC sALG-2LP to inhibit expression of the protein by inhibiting transcription  
 CC or translation. sALG-2LP proteins are used for identifying compounds  
 CC modulating the activity of a protein involved in apoptosis which may provide  
 CC novel therapeutic approaches for treatment of disorders characterised by  
 CC deregulated programmed cell death, e.g. Alzheimer's disease, Parkinson's  
 CC and other Lewy diffuse body diseases, multiple sclerosis, amyotrophic  
 CC lateral sclerosis, proliferative disorders etc

 XX and neurodegenerative disorders.  
 PT  
 XX Example; Page 22; 34pp; English.  
 PS  
 XX This invention describes a novel human metalloprotease (MPROT)13  
 CC polypeptide (I), which can be used for gene therapy. (I) and  
 CC polynucleotides encoding it can be used to treat arthritis, respiratory  
 CC disease, thrombosis, diabetes, cancer, inflammatory disorders,  
 CC osteoporosis, cardiovascular disorders, neurodegenerative diseases, and  
 CC central nervous system disorders. Modulators of (I) can be used to treat  
 CC conditions associated with MPROT13 imbalance. (I) can also be used in  
 CC diagnostic assays to detect diseases associated with inappropriate  
 CC MPROT13 activity, or levels. The polynucleotides can be used as  
 CC hybridization probes for cDNA and genomic DNA and as primers for  
 CC polymerase chain reaction, to isolate full length cDNAs and genomic  
 CC clones of other genes which have high similarity to the polynucleotide

CC sequence encoding (I). This sequence represents a PCR primer used in the  
 CC amplification of the human MPROT13 protein described in the method of the  
 CC invention

 XT Treating proliferative skin or eye diseases and scarring, using ribozymes  
 PT that cleave RNA encoding cytokines involved in inflammation, matrix  
 PT metalloproteinases, growth factors and cell-cycle dependent kinases.  
 XX  
 PS Example 1; Page 328; 408pp; English.  
 XX  
 CC The present invention describes a method for treating a proliferative  
 CC skin or eye disease and scarring. The method involves administering a  
 CC ribozyme (I) which cleaves RNA encoding a cytokine involved in  
 CC inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle  
 CC dependent kinase, growth factor or a reductase, or administering a  
 CC nucleic acid molecule (II) comprising a promoter operably linked to a  
 CC nucleic acid segment encoding (I). (I) can have antipsoriatic,  
 CC dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling,  
 CC ophthalmological, vulnery, keratolytic and virucide activities, and  
 CC cleaves RNA encoding cytokine involved in inflammation. (I) can be used  
 CC in gene therapy. (I) and (II) are useful for treating proliferative skin  
 CC diseases such as psoriasis, atopic dermatitis, actinic keratosis,  
 CC squamous or basal cell carcinoma and viral or seborrheic wart. They can  
 CC also be used for treating proliferative eye diseases such as diabetic  
 CC retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of  
 CC prematurity and retinal detachment, and for treating and preventing  
 CC scarring such as keloid, adhesion and hypertrophic or hypertrophic burn  
 CC scar. AAC61102/c represents sequences used in the

XX Isolated hepatitis C virus (HCV) proteins formed by expression of
PT overlapping open reading frames in the core protein gene sequence through
PT a frame shifting mechanism, useful for vaccinating against, and detecting
```

```
PT HCV infections.
XX Example 5; Fig 6B; 37pp; English.
XX The invention relates to an isolated and purified protein of the
CC hepatitis C virus (HCV) that is formed by expression of an overlapping
CC open reading frame in the core protein gene sequence through an RNA frame
CC shifting mechanism. The protein is termed p17 (the full length, unshifted
CC protein being p21c). Also included are a vaccine (including a DNA
CC vaccine) for immunising a mammal against hepatitis C (producing a
CC protective antibody) comprising at least 1 protein of p17 (or a nucleic
CC acid encoding p17), an anti-viral composition (used to treat hepatitis C)
CC comprising a compound that binds to p17, antibodies directed against an
CC HCV core protein which are elicited by immunising an animal using the
CC partially purified protein p17, a method for analysing an HCV antigen in
CC a sample using the anti-p17 antibodies and detection of anti-HCV
CC antibodies in a sample using the p17 proteins. The HCV p17 and the DNA
CC sequences that encode it may be used as vaccines for immunising patients
CC against HCV infection. The antibodies and the antiviral compound may also
CC be used for treating HCV infections. HCV p17 and the antibodies may also
CC be used in immunoassays for detecting HCV antigens and/or antibodies in
CC samples for the diagnosis of HCV infections. The present sequence
CC represents part of the an HCV core protein DNA from the frameshift region

XX Predicting responsiveness of a subject with breast cell proliferative
PT disorder, useful for treating or differentiating breast cell
PT proliferative disorders comprises analyzing methylation pattern of a
PT genomic DNA from the subject.
XX Disclosure; SEQ ID NO 1834; 104pp; English.
```

XX The invention relates to a novel method for predicting the responsiveness  
 CC of a subject with a cell proliferative disorder of the breast tissues to  
 CC a therapy comprising analysing the methylation pattern of a target  
 CC nucleic acid by contacting at least one of the target nucleic acids in a  
 CC biological sample obtained from the subject prior to or during treatment.  
 CC The method of the invention has cytostatic activity, and may have a use  
 CC in gene therapy. The set of oligonucleotides comprising at least two of  
 CC the oligomers are useful for detecting the cytosine methylation state  
 CC and/or single nucleotide polymorphisms (SNPs) within the sequences. The  
 CC methods, nucleic acid, oligonucleotide, and kit are useful for the  
 CC treatment, characterisation, classification and/or differentiation, of  
 CC breast cell proliferative disorders. The method is also useful for  
 CC predicting the responsiveness of a subject with a cell proliferative  
 CC disorder of the breast tissues to a therapy. The present sequence is used  
 CC in the exemplification of the invention.

 XX Identifying substance which modulates activity of transforming growth  
 PT factor beta-activated kinase 1 (TAK1) useful for treating inflammatory  
 PT diseases, involves combining candidate substance with kinase and  
 PT measuring activity of kinase.  
 XX  
 PS Example 1; Page 11; 17pp; English.  
 XX  
 CC The invention relates to a method of identifying (M1) a substance  
 CC suitable for use in the treatment of an inflammatory disease which  
 CC modulates the activity of transforming growth factor beta-activated  
 CC kinase 1 (TAK1), by combining a candidate substance with the kinase and  
 CC measuring the effect of the candidate substance on the activity of the  
 CC kinase. (M1) is useful for identifying a substance suitable for use in  
 CC the treatment of an inflammatory disease which modulates the activity of

CC TAK1. (II), (III) or (IV) is useful in preparation of a pharmaceutical  
 CC that inhibits the accumulation of leukocytes in a human tissue or in  
 CC preparation of pharmaceutical for the treatment of an inflammatory  
 CC disease. The inflammatory disease is a respiratory disease which is  
 CC asthma, chronic obstructive pulmonary disease, cystic fibrosis,  
 CC adult/acute respiratory distress syndrome or allergic rhinitis. The  
 CC respiratory disease is chronic obstructive pulmonary disease (COPD) (all  
 CC claimed). The substance identified by (M1) is useful for treating  
 CC inflammatory disease such as neutrophil associated inflammatory or  
 CC obstructive airways diseases including COPD, chronic bronchitis and  
 CC emphysema, cystic fibrosis and adult (or acute) respiratory distress  
 CC syndrome (ARDS), rheumatoid arthritis and inflammatory bowel diseases  
 CC such as Crohn's disease and ulcerative colitis. The substance identified  
 CC by (M1) is useful for treating eosinophil-associated inflammatory or  
 CC obstructive airways diseases such as asthma and allergic rhinitis. This  
 CC sequence corresponds to a PCR primer to amplify the TAK1 gene from a  
 CC retroviral insert following selection based on a reduction of ICAM-1  
 CC expression in A549.tTA.G3 cells.

 PT Detecting hepatic cell proliferative disorder useful for detecting  
 PT hepatocellular carcinoma comprises detecting a methylated CpG-containing  
 PT glutathione-S-transferase nucleic acid.  
 XX  
 PS Claim 83; Page 42; 64pp; English.  
 XX  
 CC The present invention describes a method for detecting hepatic cell  
 CC proliferative disorders. The method comprises detecting a methylated CpG-  
 CC containing glutathione-S-transferase (GST) nucleic acid (I) in a hepatic  
 CC specimen or a biological fluid, where a methylated GST nucleic acid is  
 CC indicative of a hepatic cell proliferative disorder. The method can be  
 CC used to diagnose hepatocellular carcinoma, and to monitor progress of its  
 CC treatment. Increasing the level of GST is useful in the treatment of

CC liver cancer, in humans or animals. The method can detect the early  
 CC stages of tumorigenesis in liver cells simply. The present sequence  
 CC represents a PCR primer which is used in the amplification of the human  
 CC glutathione S-transferase pi gene (GSTP1) promoter in an example from the  
 CC present invention for mapping somatic GSTP1 CpG island DNA  
 CC hypermethylation changes by genomic sequencing after bisulfite treatment

XX PT Novel isolated polynucleotide comprising a sequence which is a polymorphic variant for a reference sequence for interleukin 3 gene useful for studying the expression and biological function of the protein.  
XX PS Claim 11; Page 16; 62pp; English.  
XX CC The invention describes an isolated polynucleotide (I) comprising a sequence which is a polymorphic variant for a reference sequence for interleukin 3 (colony-stimulating factor) (IL3) gene or its fragment. (I) is useful for studying the expression and biological function of IL3, as well as in developing drugs targeting the IL3 protein. A transgenic animal is useful for studying expression of IL3 isogenes in vivo, for in vivo screening and testing of drugs targeted against IL3 protein, and for testing the efficacy of therapeutic agents and compounds for diseases of the central nervous system e.g. multiple sclerosis, Alzheimer's disease, Parkinson's disease and CNS injury, and immune or inflammatory disorders. The method described in the invention is useful in developing diagnostic tests and therapeutic treatments for diseases of the central nervous system and immune or inflammatory disorders. This sequence represents an allele specific oligonucleotide primer for detecting polymorphisms in the IL-3 gene

XX  
XX This sequence represents a primer of the invention. The invention relates  
CC to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta  
CC -N3'; or (X)m5'-(gamma)k-delta-N3'; where X = a labelled compound and/or  
CC a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n =  
CC natural number indicating the repetition of alpha; beta, delta = V or N;  
CC V = adenine, guanine or cytosine; N = adenine, guanine, cytosine or  
CC thymine; gamma = thymine; k = natural number of 3 or over indicating the  
CC repetition of gamma, in which thymine expressed by gamma is composed of  
CC 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are  
CC useful as primers for RT-PCR and determination of base sequences. The new  
CC sequences allow for reproductive and highly efficient analysis of gene  
CC sequences

XX New isolated nucleic acid, useful for treating viral diseases associated  
PT with tumors and cell degeneration, also related polypeptides, antibodies  
PT and transfected cells.  
XX  
PS Disclosure; Page 120; 720pp; French.  
XX  
XX The invention relates to a novel isolated 17 mer nucleic acid sequence,  
CC given in the specification, a sequence containing at least 15 consecutive  
CC nucleotides from the 17 mer sequence, a sequence with, after optimal  
CC alignment, at least 80 % identity to the 17 mer sequence, a sequence that  
CC hybridizes to them under highly stringent conditions, or the complement  
CC of any of them, or the corresponding RNA. The novel isolated nucleic  
CC acids of the invention are useful as probes and primers for detecting,  
CC identifying, quantifying and/or amplifying a nucleic acid, e.g. as one

CC component of a gene chip, in vitro as (anti)sense reagents, and for  
CC production of recombinant polypeptides. Any of the nucleic acids,  
CC polypeptides, vectors containing the nucleic acids, cells containing the  
CC vector or antibodies directed against the polypeptides are useful for  
CC preparation of pharmaceuticals for prevention and/or treatment of viral  
CC diseases that are characterised by development of tumours or cell  
CC degeneration, specifically cancer but also Alzheimer's disease and  
CC schizophrenia. Analysis of the expression of the 17 mer nucleic acids in  
CC patient samples is useful for diagnosis and/or prognosis of these  
CC diseases. The polypeptides can also be used to generate antibodies, and  
CC both the polypeptide and antibodies are useful as components of protein  
CC chips. The nucleic acid sequences of the invention can be used in gene  
CC therapy. This polynucleotide sequence represents a tumour suppression  
CC related human fukutin oligonucleotide of the invention

PT protein kinase PKR genes, for treating cancer and inflammatory disease.  
XX  
PS Claim 59; SEQ ID NO 2942; 317pp; English.  
XX  
XX The invention comprises nucleic acids (e.g. antisense oligonucleotides)  
CC that down regulate the expression or inhibit the function of a receptor

CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),  
 CC IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the  
 CC invention are useful for treating: cerebrovascular accident, central  
 CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,  
 CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,  
 CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune  
 CC disease, lupus, multiple sclerosis, transplant/graft rejection,  
 CC ischemia/reperfusion injury, glomerulonephritis, sepsis, and allergic  
 CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The  
 CC nucleic acids of the invention are also useful for down-regulating the  
 CC expression of a target gene and as a diagnostic tool to examine genetic  
 CC drifts and mutations within diseased cells or to detect the presence of a  
 CC target RNA in a cell. The present RNA sequence represents a human PKR  
 CC substrate sequence.

XX New oligonucleotide specific for apolipoprotein-J polymorphisms - used  
 PT to identify patients susceptible to Alzheimer's disease or prostate  
 PT cancer.

XX Example 1; Page 20; 62pp; English.

XX AAT41527-T41541 are exon-specific PCR primers used for the amplification  
 CC of exons 2-8 of the human apolipoprotein-J (ApoJ) gene. The primers were  
 CC used in a method for detecting polymorphisms associated with an allelic  
 CC variation in the ApoJ gene. The oligonucleotide (OG) detects the  
 CC probability of a person developing Alzheimer's disease (AD), preferably  
 CC in patients of African or Hispanic descent. The OG also detects the  
 CC probability of a person developing a cognitive disorder, or a prostatic  
 CC carcinoma. Transgenic mammals expressing an allelic variant of an ApoJ  
 CC gene may be used as a prognostic and diagnostic means for studying AD,  
 CC and to determine the effectiveness of therapeutic drugs

PT New anti-proliferative substance comprising a radiolabelled DNA carrier,
PT useful for preventing or treating uncontrolled cellular proliferation
PT e.g. restenosis, cancer or malignant tumors.
XX
PS Claim 13; SEQ ID NO 8; 28pp; English.
XX
CC The invention relates to an anti-proliferative substance for preventing
CC uncontrolled cellular proliferation comprising a radiolabelled DNA
CC carrier, where a radioisotope is located internally within the DNA
CC sequence, at 5', end or at 3', end, and the radiolabelled DNA carrier
CC penetrates the cell membrane and is retained intracellularly for a time
CC sufficient for the radio-isotope to effect a dose therapy. The carrier in
CC the anti-proliferative substance is an oligonucleotide, which is linear
CC or a plasmid, which is circular. The plasmid is of viral or bacterial
CC origin. The oligonucleotide is a double- or a single-stranded DNA

```

PT Determining common functional alleles in a population - useful in the
PT diagnosis of disease associated with allelic heterogeneity.
XX
PS Example 1; Page 24; 78pp; English.
XX
CC The invention relates to methods of determining a functional allele
CC profile of a gene in a population. Functional allele profiles comprise
CC the commonly occurring alleles in a population, and the relative
CC frequencies at which such alleles of a given gene occur. The methods are
CC used to identify and determine the frequency of the functional alleles of
CC genes which display extensive allelic heterogeneity, particularly those
CC implicated in disease or conditions, such as the BRCA1 gene associated
CC with breast cancer, CFTT associated with cystic fibrosis, dystrophin
CC associated with Duchenne muscular dystrophy and Becker muscular
CC dystrophy, and p53 associated with Li-Fraumeni syndrome. The methods can
CC also be employed for diseases where allelic and genetic heterogeneity
CC exist, such as breast cancer, neurofibromatosis, and hereditary non-
CC polyposis colorectal cancer. Identification of functional alleles is
CC necessary for identification of mutations which may be implicated in the
CC disease. Sequences AAZ32001-172 represent primers for determining the

```

CC functional allele profiles of various genes. The primers are specific for  
CC genes such as MSH2 gene, MLH1 gene, BRCA1 gene, BRCA2 gene and BAP1 gene

XX Determining a functional allele profile of a gene in a population by  
PT identifying the nucleotide sequence of a gene of genomic DNA from each of  
PT the individuals with a family history of functional alleles of the gene  
PT of interest.

XX Example 1; Page 9; 28pp; English.

XX The present invention relates to a method for determining a functional  
CC allele profile of a gene in a population. The method comprises  
CC identifying the nucleotide sequence of a gene of interest out of genomic  
CC DNA from each of a population of individuals identified as having a  
CC family history which indicates inheritance of functional alleles of the  
CC gene of interest, and rank ordering the frequency of occurrence of each  
CC haplotype, where the identity of the alleles containing each haplotype  
CC and the determination of their relative frequencies constitutes the  
CC functional allele profile of the gene of interest in the population. The  
CC method is useful for determining functional allele profiles which are  
CC useful in the treatment and diagnosis of diseases, for genetic and  
CC pharmacogenetic applications, and for evaluating the degree to which the  
CC gene(s) are under selective pressure. The present sequence represents a  
CC PCR primer used in the method of the invention.

XX Assessing the metabolic state of a cell comprises isolating at least one  
PT mRNA complex comprising at least one RNA binding protein, and at least  
PT one mRNA or at least one mRNA complex-associated protein.

XX Example 4; Page 35; 86pp; English.

XX The present invention describes a method for assessing the metabolic  
CC state of a cell. The method comprises isolating at least one mRNA complex  
CC having at least one RNA binding protein, and at least one mRNA or at  
CC least one mRNA complex-associated protein, and determining the expression  
CC level of the mRNA or mRNA complex-associated protein, where the level of  
CC expression of the at least one mRNA or the at least one mRNA complex-  
CC associated protein is indicative of the metabolic state of the cell. The  
CC method can be used for assessing the metabolic state in a cell, and for  
CC identifying and evaluating mRNA and protein targets associated with mRNA  
CC complexes and implicated in the expression of proteins involved in common  
CC physiological pathways. The present sequence represents a TGF beta 2 3'-  
CC UTR consensus sequence, which is used in an example from the present  
CC invention.

XX
XX Claim 14; Page 34; 40pp; French.
XX
XX The region corresponding to nucleotides 438-751 encoding the
CC M.tuberculosis 65kD antigen is highly conserved among mycobacteria. DNA
CC fragments having at least 70 per cent homology to this region and to the
CC corresponding region from other species are claimed. PCR amplification of
CC the appropriate region is performed using oligonucleotides AAQ57768 and
CC AAQ57769 as primers. The primers were designed to be "universal", i.e. to
CC amplify DNA from all Mycobacteria. Oligonucleotide AAQ57781 is a probe
CC specific to species belonging to the Mycobacterium avium-intracellular
CC complex; it hybridises to a species-specific sequence within the
CC amplified region. (Updated on 25-MAR-2003 to correct PN field.)

XX
XX Solid phase immunoassay using oligo:nucleotide as label - also new
PT conjugates of oligo:nucleotide coupled to antigenic peptide, partic. for
PT diagnosing hepatitis C or E virus infection.
XX
XX Example; Page 12; 34pp; English.
XX
XX AAR62941 and AAR62942 are examples of synthetic immunoreactive peptides.
CC They are used in a method for detecting an antigen in a subject. The
CC method involves binding the antigen to a solid support and then reacting
CC it with an immunoreactive ligand (L) bound to an oligo; removing any
CC unreacted L, and then detecting the presence of the oligo. A similar
CC method can be used to detect Ab, in which case the ligand is an oligo-
CC labelled Ag. The use of an amplifiable oligo as the label allows Ag or Ab
CC to be detected at very low levels. An exemplary oligo is AAQ75024 which
CC can be covalently attached by the 5'- terminus to the N- or C-terminal of
CC a synthetic peptide. In the example, peptide AAR62941 was coupled to
CC oligo AAQ75024 using disuccinimidyl suberate. Serum samples suspected to
CC contain HEV Abs were immobilised on plastic tubes or wells, then
CC incubated for 30-60 mins with the peptide-oligo product. The vessels were
CC washed; bound oligo was released with 0.2M glycine and amplified in a
CC separate tube using as primers AAQ75025 and AAQ75026 in 30 cycles of PCR.
CC The amplification product - AAQ75031 - was treated with uracil DNA
CC glycosylase to remove the U18 fragment, and the product captured by
CC immobilised oligo-dT. (Updated on 23-MAR-2003 to correct FN field.)

XX
XX Oligo:nucleotide(s) capable of forming guanosine tetrads - inhibit viral
PT enzyme responsible for integrating viral nucleic acid into the host
PT genome.
XX
XX Claim 3; Page 164; 245pp; English.
PS
XX
XX AAT51619-T51698 are oligonucleotides used to inhibit the production of
CC viruses within a host cell. The oligonucleotides may form guanosine
CC tetrads (structures formed of eight hydrogen bonds by coordination of the
CC four oxygen atoms of guanine with alkali cations believed to bind to the
CC centre of a quadruplex, and by strong stacking interactions) and are used
CC to prevent the integration of viral nucleic acid into a host genome. The
CC oligonucleotides inhibit functioning of the integrase enzyme and hence
CC prevent viral infection. Viral infections that may be treated include
CC human immunodeficiency virus (HIV), Epstein Barr virus (EBV), herpes
CC simplex virus (HSV), human papilloma virus (HPV), adenovirus, respiratory
CC syncytial virus (RSV), cytomegalovirus (CMV) and hepatitis B virus (HBV),
CC especially HIV-1 infection

PT with antibiotics.

XX

PS Claim 49; Page 87; 163pp; English.

XX

XX This antisense oligonucleotide is nuclease resistant and can be used in

CC the treatment of animals, including humans, having a bacterial infection.

CC The treatment comprises administration of such nuclease resistant

CC oligonucleotides, targeted to a nucleic acid or protein of the bacterium,

CC and formulated with a carrier. A compound comprising this nuclease

CC resistant oligonucleotide can be covalently linked to an antibiotic. The

CC method is used to treat infections by a wide variety of Gram-positive and

CC Gram-negative, or acid-fast, bacteria, in human and veterinary medicine.

CC The methods are particularly used in immuno-compromised individuals (e.g.

CC patients with acquired immunodeficiency syndrome or those receiving

CC chemotherapy or radiation therapy), optionally in combination with, or

CC fused to, antiviral or other antimicrobial oligonucleotides. Apart from

CC therapeutic use, the oligonucleotides can be used to control bacteria in

CC laboratory cultures, foods, beverages and industrial processes. The

CC oligonucleotides are specific for bacteria, without affecting metabolism

CC in mammalian cells. They may also activate RNase H and have a general,

CC non-specific immune-stimulating effect. The oligonucleotides can be

CC administered orally, intranasally, rectally, topically or by injection,

CC optionally coupled to an agent (e.g. carbohydrate or polyamine) that

XX enhances cellular uptake

XX  
XX This sequence is an immunosuppressant inhibitor oligonucleotide, which is  
CC used in the invention. The invention relates to a composition which  
CC contains at least one inhibitor (less than 100 kD) of a substance (e.g.  
CC transforming growth factor TGF-beta, vascular endothelial growth factor  
CC VEGF, interleukin-10 IL-10, prostaglandin E2 PGE2, or their receptors)  
CC that adversely affects the immune response. The composition also includes  
CC at least one stimulant that positively affects the immune response. This  
CC oligonucleotide is an example of an inhibitor that is used in the  
CC composition. The composition is used as an immunostimulant for the  
CC treatment of neoplasms and infections, particularly hyperproliferation;  
CC leukaemia; (non-)Hodgkin's lymphoma; carcinoma of oesophagus, bronchi,  
CC colon-rectum, stomach, intestine, gall bladder or duct, pancreas, anus,  
CC breast, ovary, cervix, endometrium, prostate or bladder), liver tumours,  
CC malignant melanoma, brain tumours and sarcomas. The oligonucleotides,  
CC most of which are directed against TGFbeta or VEGF, are inhibitors of  
CC monocyte chemotactic protein-1 (MCP-1) and are useful as anti-  
CC inflammatory for treating e.g. asthma, Crohn's disease, ulcerative  
CC colitis, diabetes, glomerulonephritis, acute respiratory distress  
CC syndrome and the formation of atherosclerotic plaque

 XX Functionalized nanocrystal carrying polynucleotide, used for detecting  
 PT target analyte, forms dendrimers with complementary nanocrystals to  
 PT amplify the fluorescent signal.  
 XX  
 XX Example 3; Page 69; 72pp; English.  
 PS  
 XX The present invention relates to functionalised nanocrystals for use in  
 CC nonisotopic detection systems for biomolecules e.g. nucleic acids, and  
 CC proteins, lipids or drugs. The nanocrystals have polynucleotide strands  
 CC attached to their surfaces with one end of the polynucleotide extending  
 CC outwardly from the nanocrystal. The present sequence is one such  
 CC polynucleotide. These nanocrystals are used with a second series of  
 CC nanocrystals, which have polynucleotides complementary to the first  
 CC polynucleotides, so that the respective complementary strands hybridise  
 CC to each other and form a dendrimer. This dendrimer produces a signal  
 CC which can then be detected e.g. fluorescence. The present sequence is  
 CC composed of Guanine bases. This sequence may therefore be used with a  
 CC polynucleotide composed mainly of Cytosine bases (AAA58388)

 DR  
 XX Determining the concentration of a target nucleic acid, useful e.g. for  
 PT detecting genetic mutations, comprises using a fluorescently labeled  
 PT probe in which emission is reduced by binding to the target nucleic acid.  
 XX  
 XX Example 5; Page 21; 55pp; English.  
 PS  
 XX The invention relates to the determination of the concentration of a  
 CC nucleic acid target, using a fluorescently labeled probe which produces  
 CC reduced fluorescence emission when hybridised to the target nucleic acid.  
 CC The method comprises measuring the reduction in emission caused by  
 CC hybridisation. The new method is particularly used to quantify target  
 CC nucleic acids by a real-time polymerase chain reaction, e.g. for  
 CC quantifying microbial cells in co-cultures or symbiotic systems, for  
 CC detecting gene mutations or polymorphisms, and for analysing melting  
 CC curves of target nucleic acids to determine a Tm value. Methods of the  
 CC invention allow target nucleic acids to be quantified quickly, easily and  
 CC accurately. Particularly there is no need to remove unbound probe, and no  
 CC materials are introduced that inhibit amplification by Taq polymerase (so  
 CC conventional PCR conditions can be used). The specificity of PCR is kept  
 CC high (amplification of primer dimers is delayed), and the limit of  
 CC quantitation is reduced. Complex probes are not needed, and amplification  
 CC can be monitored in real time. The working graph for data analysis  
 CC (automatically generated by a computer) has a higher correlation  
 CC coefficient than conventional graphs so more accurate quantitation is  
 CC possible. The current sequence represents a nucleic acid probe of the  
 CC invention that was used for investigating the base selectivity of a  
 CC target nucleic acid

XX Mixture useful in preparation of medicament for treating tumors and  
PT immune disorders, comprises an inhibitor or suppressor of expression of a  
PT gene, and a molecule binding to expression product of the gene.  
XX  
XX Claim 16; Page 2; 16pp; English.  
XX  
XX The invention relates to a mixture comprising an inhibitor or suppressor  
CC of a gene and a molecule binding to an expression product of that gene.  
CC The gene is selected from the group consisting of TGF-beta, erbB-2, MIA,  
CC c-jun, junB, c-fos, VCAM, NF-kappaB p65, NF-kappaB p50, ICAM, VEGF and NF  
CC -kappa B 2. Molecules including drugs are used to modulate biological  
CC functions through gene products and their derivatives - like e.g.  
CC glycosylated, phosphorylated or otherwise modified gene products, have  
CC either stimulated or inhibited gene products and/or their derivatives.  
CC The mixture is useful in the preparation of a medicament for treating  
CC tumours, immune disorders or for improving organ or cell transplantation  
CC or cell expansion, where inhibition of tumour growth, improvement of  
CC organ or cell transplantation or cell expansion and enhancement or  
CC inhibition of immune response is enhanced in a supra-additive manner. The  
CC mixture is useful in drug target validation, i.e., to identify genes that  
CC are relevant for certain pathological state by testing the effect of the  
CC mixture on a cell system or organism. The present sequence is a human  
CC oligonucleotide useful in drug target validation

XX Human leukocyte antigen (HLA) typing, useful for judging HLA genotypes of  
PT individuals e.g. by determining immunogenetic differences when  
PT transplanting between them.  
XX  
XX Claim 10; Page 146; 345pp; Japanese.  
PS  
XX The invention relates to a typing kit for judging human leukocyte antigen  
CC (HLA) genotype of a sample by hybridising a substrate on which 10-24 base  
CC oligonucleotides (ABL30512-ABL31809) originating in the sequences of  
CC genes e.g. belonging to HLA class I antigens on human genome and  
CC containing gene polymorphisms as alloantigens have been immobilised as  
CC primers for amplification of cleaved nucleic acids relating to gene

CC polymorphisms. The method is useful for judging HLA genotypes of  
 CC individuals by determining immunogenetic differences before transplanting  
 CC between them, providing genetic information to decide compatibility of  
 CC organ and tissue for transplantation e.g. of bone marrow, kidney, liver,  
 CC pancreas, Langerhans islet in pancreas and cornea, susceptibility  
 CC diagnosis of genetic diseases and identifying individuals

 XX Improved polymerase thermocycling reaction for nucleic acid  
 PT amplification, by thermal cycling of promoter-linked nucleic acid  
 PT template synthesis and in vitro transcriptional amplification of nucleic  
 PT acid sequences.  
 XX  
 PS Example 3; Page 14; 28pp; English.  
 XX  
 CC The invention relates to an improved polymerase thermocycling reaction  
 CC (M1) for linear amplification of nucleic acid sequences, involves  
 CC denaturing a number of nucleic acid templates (I), combining the  
 CC denatured (I) with a promoter-containing primer (P1), a primer (P2), a  
 CC number of deoxynucleotide triphosphates and ribonucleotide triphosphates,  
 CC a reverse transcription enzyme, a DNA-dependent DNA polymerase and RNA  
 CC polymerase, contacting P1 with (I) to generate a number of promoter-  
 CC containing templates, denaturing the promoter-containing templates,  
 CC contacting P2 with the denatured promoter-containing templates to  
 CC generate a number of promoter-containing double-stranded DNA templates,  
 CC where the double-stranded nucleic acid templates are flanked by P1 in one  
 CC end and P2 in the other end of the other orientation, transcribing the  
 CC promoter-containing double-stranded DNA templates to form a number of  
 CC amplified RNA sequences, including the primer region of the promoter-  
 CC containing double-stranded DNA templates, contacting the amplified RNA  
 CC sequences with P2 to form a number of cDNAs and a number of DNA-RNA  
 CC hybrid templates, and denaturing the DNA-RNA hybrid templates. The method  
 CC is useful for improved polymerase thermocycling reaction for linear  
 CC amplification of nucleic acid sequences, and thus for producing mRNA

CC expression profile of a cell by M1 to generate multiple copies of the  
 CC mRNA. M1 is also useful for determining aberrant protein production of  
 CC cells in a diseased state, by generating an expression profile by the  
 CC above method, of cells in both normal and diseased states, comparing the  
 CC expression profile of the cells in the normal and diseased states, the  
 CC determining the differences in mRNA composition of the cell(s) in the  
 CC diseased state, isolating the mRNA sequences of cell(s) in the diseased  
 CC state that differ from mRNA in cell(s) in non-diseased state, amplifying  
 CC the isolated mRNA by M1, and determining aberrant protein function of the  
 CC protein coded for by the isolated mRNA. M1 is also useful for treating a  
 CC cell in a diseased state caused by aberrant protein production, by  
 CC determining protein expression of a cell in a diseased state, determining  
 CC the mRNA sequence for the aberrant proteins, synthesising an antisense  
 CC sequence of the mRNA, amplifying the antisense mRNA sequences by M1, and  
 CC delivering a pharmaceutically effective dosage of a composition  
 CC comprising the anti-sense mRNA and a compatible lipid based biological  
 CC carrier. M1 is also useful for predicting the efficacy of a proposed drug  
 CC targeted against an aberrant protein, by determining aberrant protein  
 CC production of cell in a diseased state by the above method, amplifying  
 CC the aberrant protein by M1 and using recombinant techniques to determine  
 CC the effect of proposed drug on the aberrant protein. M1 is also useful  
 CC for differential screening of tissue-specific gene expression at a  
 CC cellular level, for preparing labeled RNA/DNA probes for a gene chip  
 CC technology, and for determining the efficacy of a drug regimen against a  
 CC gene or its cDNAs. The present sequence is an Oligo (dC) primer used to  
 CC produce second strand cDNA in the method of the invention

 PT Detecting and differentiating between colon cell proliferative disorders  
 PT associated with a gene or its regulatory regions comprises contacting a  
 PT target nucleic acid in a biological sample obtained from the subject with  
 PT a reagent.

XX PS Claim 36; Page 46; 74pp; English.

CC The invention relates to a novel method for detecting and differentiating  
CC between colon cell proliferative disorders associated with at least one  
CC gene or its regulatory regions. The method comprises contacting a target  
CC nucleic acid in a biological sample obtained from the subject with at  
CC least one reagent or a series of reagents, where the reagent or series of  
CC reagents, distinguishes between methylated and non methylated CpG  
CC dinucleotides within the target nucleic acid. The molecules of the  
CC invention demonstrate cytostatic activity whilst the method may be useful  
CC for detecting and differentiating between colon cell proliferative  
CC disorders, including cancers such as colon adenoma and colon carcinoma.  
CC The PNA (peptide nucleic acid)-oligomers are useful as probes for  
CC determining cytosine methylation state or single nucleotide  
CC polymorphisms. The current sequence is that of the hybridisation  
CC oligonucleotide of the invention which was used to analyse the genomic  
CC DNA region.

XX PT Recombinant kid pregastric esterase useful for producing of enzyme  
PT modified cheeses acceptable to kosher and vegetarian consumers.

XX PS Disclosure; Fig 6; 35pp; English.

XX CC The invention describes an isolated kid pregastric esterase (kPGE)  
CC polynucleotide (I) encoding a fully defined sequence of 378 amino acids  
CC as given in the specification. Also described are: a transforming nucleic  
CC acid molecule comprising a plasmid or vector comprising (i); a non-kid  
CC cell capable of recombinantly expressing the kid pregastric esterase,  
CC which has been transformed with the transforming nucleic acid; and  
CC recombinantly producing kid pregastric esterase. The polynucleotides and  
CC methods are useful for producing kPGE in very pure form free of the other  
CC substances found in the present commercial rennet formulations. The  
CC uncontaminated kPGE is also useful for producing enzyme-modified cheeses  
CC (EMC's) acceptable to kosher and vegetarian consumers. The fusion  
CC polynucleotide of kid pregastric esterase and polyHis-enterokinase  
CC increases expression of esterases and lipases when fused to the N  
CC terminal of the enzyme. This sequence represents a linker or primer  
CC oligonucleotide used in the creation of a kid lingual tissue cDNA library  
CC used in the isolation of a kid pregastric esterase.

XX Novel transcriptional regulatory DNA sequence of MEGSIN gene, useful for  
PT regulating mesangial cell specific transcription, and for identifying  
PT compounds which control expression of MEGSIN gene.  
XX  
XX Disclosure; SEQ ID NO 13; 20pp; Japanese.  
XX  
XX The invention describes DNA (I) which has positive transcription  
CC regulatory activity having at least 15 continuous bases containing a  
CC specific 9 base pair sequence of a fully defined human MEGSIN gene  
CC sequence of 4230 nucleotides as given in specification, or a sequence of  
CC at least 15 continuous bases of (SI) in which one or more bases are  
CC substituted, deleted and/or added other than the specific 9 base pair  
CC sequence. (I) is useful for screening of compound which couples with (I),  
CC which controls coupling of (I) and AP-1, and which controls  
CC transcriptional activity, respectively. A transcriptional regulatory  
CC agent (II) containing (I) is useful for regulating transcription of  
CC MEGSIN gene. (II) is useful either as a transcription promoter or  
CC transcription inhibitor of the MEGSIN gene, and transcription inhibitor  
CC is useful for treating renal diseases associated with proliferation of  
CC kidney mesangial cells such as Iga glomerulonephritis, systemic lupus  
CC erythematosus (SLE), nephropathy, diabetic nephropathy, cryoglobulin and  
CC nephropathy. (I) allows identification of compounds that regulate  
CC transcription of human MEGSIN gene, and thus for treating MEGSIN gene  
CC associated renal diseases. This sequence represents a primer associated  
CC with the human MEGSIN gene.

XX PT Constructing synthetic polynucleotide for modulating the quality of a
XX PT selected phenotype displayed by an organism comprises replacing a first
XX PT codon with a synonymous codon to construct the synthetic polynucleotide.
XX PS Example 1; SEQ ID NO 63; 86pp; English.
XX CC The present invention describes a method for constructing a synthetic
XX CC polynucleotide from which a polypeptide is producible to confer a
XX CC selected phenotype to an organism of interest or part in a different
XX CC quality than that conferred by a parent polynucleotide that encodes the
XX CC same polypeptide. The method comprises: (a) selecting a first codon of
XX CC the parent polynucleotide for replacement with a synonymous codon, where
XX CC the synonymous codon is selected on the basis that it exhibits a
XX CC different phenotypic preference than the first codon in a comparison of
XX CC phenotypic preferences in test organisms or parts, where the test
XX CC organism are selected from organisms of the same species as the organism
XX CC of interest and organisms that are related to the organisms of interest;
XX CC and (b) replacing the first codon with the synonymous codon to construct
XX CC the synthetic polynucleotide. Also described: (1) a method for
XX CC determining the phenotypic preference of a first codon in an organism of
XX CC interest or its parts; (2) a synthetic polynucleotide constructed from
XX CC the method above; (3) an organism of interest or part containing a
XX CC synthetic polynucleotide constructed from the method above; (4) an
XX CC organism of interest or part containing a synthetic construct that
XX CC comprises a regulatory polynucleotide operably linked to a tandem repeat
XX CC of a first codon fused in frame with a reporter polynucleotide that
XX CC encodes a reporter protein, which produces, or is predicted to produce a
XX CC selected phenotype or a phenotype of the same class as the selected
XX CC phenotype in the organism or part; (5) a method of modulating the quality
XX CC of a selected phenotype that is displayed by an organism of interest or
XX CC part and that results from the expression of a parent polynucleotide that
XX CC encodes the polypeptide; (6) a method of enhancing the quality of a

XX Constructing synthetic polynucleotide for modulating the quality of a  
PT selected phenotype displayed by an organism comprises replacing a first  
PT codon with a synonymous codon to construct the synthetic polynucleotide.  
XX Example 1; SEQ ID NO 45; 86pp; English.  
XX The present invention describes a method for constructing a synthetic  
CC polynucleotide from which a polypeptide is producible to confer a  
CC selected phenotype to an organism of interest or part in a different  
CC quality than that conferred by a parent polynucleotide that encodes the  
CC same polypeptide. The method comprises: (a) selecting a first codon of  
CC the parent polynucleotide for replacement with a synonymous codon, where  
CC the synonymous codon is selected on the basis that it exhibits a  
CC different phenotypic preference than the first codon in a comparison of  
CC phenotypic preferences in test organisms or parts, where the test  
CC organism are selected from organisms of the same species as the organism  
CC of interest and organisms that are related to the organisms of interest;  
CC and (b) replacing the first codon with the synonymous codon to construct  
CC the synthetic polynucleotide. Also described: (1) a method for  
CC determining the phenotypic preference of a first codon in an organism of  
CC interest or its parts; (2) a synthetic polynucleotide constructed from  
CC the method above; (3) an organism or interest or part containing a  
CC synthetic polynucleotide constructed from the method above; (4) an  
CC organism or interest or part containing a synthetic construct that  
CC comprises a regulatory polynucleotide operably linked to a tandem repeat  
CC of a first codon fused in frame with a reporter polynucleotide that  
CC encodes a reporter protein, which produces, or is predicted to produce a  
CC selected phenotype or a phenotype of the same class as the selected  
CC phenotype in the organism or part; (5) a method of modulating the quality  
CC of a selected phenotype that is displayed by an organism of interest or  
CC part and that results from the expression of a parent polynucleotide that  
CC encodes the polypeptide; (6) a method of enhancing the quality of a  
CC selected phenotype that is displayed by an organism of interest or part  
CC and that results from the expression of a parent polynucleotide that  
CC encodes the polypeptide; (7) a method of reducing the quality of a  
CC selected phenotype that is displayed by an organism of interest or part  
CC and that results from the expression of a parent polynucleotide that  
CC encodes the polypeptide. The method is useful for constructing a  
CC synthetic polynucleotide from which a polypeptide is producible to confer  
CC a selected phenotype to an organism of interest or part in a different  
CC quality than that conferred by a parent polynucleotide that encodes the  
CC same polypeptide. It is useful for modulating the quality of a selected  
CC phenotype displayed by an organism or part. The present sequence encodes  
CC a synthetic leader sequence, which is used in an example from the present  
CC invention.

 PT Constructing synthetic polynucleotide for modulating the quality of a  
 PT selected phenotype displayed by an organism comprises replacing a first  
 PT codon with a synonymous codon to construct the synthetic polynucleotide.  
 PS Example 1; SEQ ID NO 35; 86pp; English.

CC The present invention describes a method for constructing a synthetic  
 CC polynucleotide from which a polypeptide is producible to confer a  
 CC selected phenotype to an organism of interest or part in a different  
 CC quality than that conferred by a parent polynucleotide that encodes the  
 CC same polypeptide. The method comprises: (a) selecting a first codon of  
 CC the parent polynucleotide for replacement with a synonymous codon, where  
 CC the synonymous codon is selected on the basis that it exhibits a  
 CC different phenotypic preference than the first codon in a comparison of  
 CC phenotypic preferences in test organisms or parts, where the test  
 CC organism are selected from organisms of the same species as the organism  
 CC of interest and organisms that are related to the organisms of interest;  
 CC and (b) replacing the first codon with the synonymous codon to construct  
 CC the synthetic polynucleotide. Also described: (1) a method for  
 CC determining the phenotypic preference of a first codon in an organism of  
 CC interest or its parts; (2) a synthetic polynucleotide constructed from  
 CC the method above; (3) an organism or interest or part containing a  
 CC synthetic polynucleotide constructed from the method above; (4) an  
 CC organism or interest or part containing a synthetic construct that  
 CC comprises a regulatory polynucleotide operably linked to a tandem repeat  
 CC of a first codon fused in frame with a reporter polynucleotide that  
 CC encodes a reporter protein, which produces, or is predicted to produce a  
 CC selected phenotype or a phenotype of the same class as the selected  
 CC phenotype in the organism or part; (5) a method of modulating the quality  
 CC of a selected phenotype that is displayed by an organism of interest or  
 CC part and that results from the expression of a parent polynucleotide that  
 CC encodes the polypeptide; (6) a method of enhancing the quality of a  
 CC selected phenotype that is displayed by an organism of interest or part  
 CC and that results from the expression of a parent polynucleotide that  
 CC encodes the polypeptide; and (7) a method of reducing the quality of a  
 CC selected phenotype that is displayed by an organism of interest or part  
 CC and that results from the expression of a parent polynucleotide that  
 CC encodes the polypeptide. The method is useful for constructing a  
 CC synthetic polynucleotide from which a polypeptide is producible to confer  
 CC a selected phenotype to an organism of interest or part in a different  
 CC quality than that conferred by a parent polynucleotide that encodes the  
 CC same polypeptide. It is useful for modulating the quality of a selected  
 CC phenotype displayed by an organism or part. The present sequence encodes  
 CC a synthetic leader sequence, which is used in an example from the present  
 CC invention.

 XX PT proliferative disorders comprises analyzing methylation pattern of a  
 XX FT genomic DNA from the subject.  
 XX XX Disclosure; SEQ ID NO 1832; 104pp; English.  
 XX CC The invention relates to a novel method for predicting the responsiveness  
 XX CC of a subject with a cell proliferative disorder of the breast tissues to  
 XX CC a therapy comprising analysing the methylation pattern of a target  
 XX CC nucleic acid by contacting at least one of the target nucleic acids in a  
 XX CC biological sample obtained from the subject prior to or during treatment.  
 XX CC The method of the invention has cytostatic activity, and may have a use  
 XX CC in gene therapy. The set of oligonucleotides comprising at least two of  
 XX CC the oligomers are useful for detecting the cytosine methylation state  
 XX CC and/or single nucleotide polymorphisms (SNPs) within the sequences. The  
 XX CC methods, nucleic acid, oligonucleotide, and kit are useful for the  
 XX CC treatment, characterisation, classification and/or differentiation, of  
 XX CC breast cell proliferative disorders. The method is also useful for  
 XX CC predicting the responsiveness of a subject with a cell proliferative  
 XX CC disorder of the breast tissues to a therapy. The present sequence is used  
 XX CC in the exemplification of the invention.

 XX PT improving efficiency and reliability in drug development for treating  
 XX PT hemolytic anemia.  
 XX PS Claim 14; Page 14; 137pp; English.  
 XX CC The present invention describes genetic variants of the human glutathione  
 XX CC reductase (GSR) gene (I). (I) has antianaemic activity and can be used in  
 XX CC gene therapy. (I) can be used in screening for drugs targeting (I) that  
 XX CC are useful for treating haemolytic anaemia. Methods from the present  
 XX CC invention can be used: for improving the efficiency and reliability of  
 XX CC several steps in the discovery and development of drugs for treating  
 XX CC diseases associated with GSR activity; for haplotyping, which is also  
 XX CC used by the pharmaceutical research scientist to validate GSR as a  
 XX CC candidate target for treating a specific condition or disease predicted  
 XX CC to be associated with GSR activity, e.g. haemolytic anaemia, and in the  
 XX CC design of clinical trials for treating a specific condition of disease  
 XX CC associated with GSR activity; and for screening compounds targeting GSR.  
 XX CC (I) is useful in studying the expression and function of GSR, and in  
 XX CC expressing GSR protein for use in screening for candidate drugs to treat  
 XX CC diseases related to GSR activity. (I) is also useful in studying the  
 XX CC effect of the variation on the biological activity of GSR as well as on  
 XX CC the binding affinity of candidate drugs targeting GSR for the treatment  
 XX CC of haemolytic anaemia. The present sequence represents an allele specific  
 XX CC oligonucleotide (ASO) primer for the human GSR gene, which is given in  
 XX CC the exemplification of the present invention. N.B. The polymorphic base  
 XX CC (showing a single nucleotide polymorphism) in the ASO primer is shown

 XX New transforming growth factor beta antisense oligo:nucleotide(s) - for  
 PT treating immunosuppression, tumours, etc.  
 PT  
 XX Claim 6; Page 51; 74pp; English.  
 PS  
 XX The antisense oligonucleotides are useful in the treatment of tumours in  
 CC which expression of TGF-beta is of relevance for pathogenicity and/or  
 CC inhibition of pathological angiogenesis. They are used especially for the  
 CC treatment of the immunosuppressive effect of TGF-beta, augmentation of  
 CC the proliferation of cytotoxic lymphocytes, treatment of endogenous  
 CC hyperexpression of TGF-beta, treatment of breast tumours, neurofibromas  
 CC and malignant gliomas, including glioblastomas, treatment and prophylaxis  
 CC of skin carcinogenesis, and treatment of oesophageal and gastric  
 CC carcinomas. See AAQ78352-Q78488. The sequences given in GENESEQ files  
 CC AAQ78352-Q78407 and AAQ78488 are antisense oligodeoxynucleotides of TGF-  
 CC beta 1. The sequences given in GENESEQ files AAQ78408-78487 are antisense  
 CC oligodeoxynucleotides of TGF-beta 2 in the form of phosphorothioate  
 CC analogues. (Updated on 25-MAR-2003 to correct PN field.)

 PT Preparation of antisense oligo:nucleotide(s) which lack long runs of  
 PT consecutive guanine or inosine - and have specific ratio of residues  
 PT able to form two or three hydrogen bonds, have greater activity and  
 PT reduced toxicity, used therapeutically or to modulate growth of cells in  
 PT culture.  
 XX  
 PS Claim 10; Fig 8a; 286pp; English.  
 PS  
 XX AAV48930-49007 represent antisense oligonucleotides directed against  
 CC transforming growth factor-beta2 (TGF-beta2). Of these, only  
 CC oligonucleotides AAV48930-67 resulted in significant reduction in TGF-  
 CC beta 2 protein expression, while oligonucleotides AAV48968-49007 had  
 CC little effect. The oligonucleotides exemplify the invention. The  
 CC specification describes oligonucleotides that contain 8-30 nucleotides,  
 CC which contain at most 8 nucleotides that can each form three hydrogen  
 CC bonds to cytosine; do not contain four consecutive nucleotides able to  
 CC form three H-bonds each to four consecutive cytosines; do not contain two  
 CC sequences of three consecutive nucleotides each able to form three H-  
 CC bonds to three consecutive cytosines, and the ratio between residues able  
 CC to form two H-bonds each (2R) or three such bonds (3R) is given by 2R/3R  
 CC = 0.33-0.72. The oligonucleotides are used to modulate expression of  
 CC genes, particularly the genes for p53, Erb-2, junB, junD, TGF-beta 1 or  
 CC beta 2 to control proliferation of primary cell cultures (e.g. bone  
 CC marrow stem, liver or kidney cells, osteoclasts, osteoblasts and/or  
 CC keratinocytes). The oligonucleotides can also be used to analyse function  
 CC of proteins (by altering their expression or activity) and  
 CC therapeutically, e.g. in cases of cancer or (targeting TGF) for  
 CC stimulating the immune system

XX This sequence represents a primer of the invention. The invention relates

CC to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta  
CC -N3'; or (X)m5'-(gamma)k-delta-N3'; where X = a labelled compound and/or  
CC a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n =  
CC natural number indicating the repetition of alpha; beta = thymine; n =  
CC V = adenine, guanine or cytosine; N = adenine, guanine, cytosine or  
CC thymine; gamma = thymine; k = natural number of 3 or over indicating the  
CC repetition of gamma, in which thymine expressed by gamma is composed of  
CC 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are  
CC useful as primers for RT-PCR and determination of base sequences. The new  
CC sequences allow for reproductive and highly efficient analysis of gene  
CC sequences

PA Thompson JD, Draper KG;
XX WPI; 1993-386203/48.
XX New enzymatic RNA molecules (ribozymes) - which cleave mRNA associated
PT with tumours or mRNA expressed from gene encoding multiple drug
PT resistance.
XX Claim 3; Fig 10; 69pp; English.
XX The sequences given in AAQ51825-2266 represent areas of mRNAs which are
CC associated with development or maintenance of chronic myelogenous
CC leukemia (CML), promyelocytic leukemia, Burkitt's lymphoma, or acute
CC lymphocytic leukemia, follicular lymphoma, B-cell acute lymphocytic
CC leukemia, breast cancer, colon carcinoma, neuroblastoma and lung cancer.
CC The full length mRNAs containing these target sequences, encode aberrant
CC cellular proteins which are able to control cellular proliferation and
CC are directly linked to a leukemic phenotype. These target sequences are
CC identified by the ribozyme of the invention. The ribozymes is formed in a
CC hammerhead motif, but may also be formed in the motif of a hairpin,
CC hepatitis delta virus, group I intron or RNaseP-like RNA. These ribozymes
CC may be used to inhibit the development or expression of a transformed
CC phenotype in man and other animals by modulating expression of the
CC corresponding gene. Cleavage of target mRNAs expressed in pre-neoplastic
CC and transformed cells elicits inhibition of the transformed state.
CC Multiple drug resistance (mdr-1) mRNA specific ribozymes remove the
CC mechanism of drug resistance used by transformed cells and thus enhances
CC drug therapies for tumours. The ribozymes may also be used to study
CC genetic drift and mutations within cells. (Updated on 25-MAR-2003 to
CC correct PN field.)

XX New enzymatic RNA molecules (ribozymes) - which cleave mRNA associated
PT with tumours or mRNA expressed from gene encoding multiple drug
PT resistance.
XX Claim 3; Fig 7; 69pp; English.
XX The sequences given in AAQ51825-2266 represent areas of mRNAs which are
CC associated with development or maintenance of chronic myelogenous
CC leukemia (CML), promyelocytic leukemia, Burkitt's lymphoma, or acute
CC lymphocytic leukemia, follicular lymphoma, B-cell acute lymphocytic
CC leukemia, breast cancer, colon carcinoma, neuroblastoma and lung cancer.
CC The full length mRNAs containing these target sequences, encode aberrant
CC cellular proteins which are able to control cellular proliferation and
CC are directly linked to a leukemic phenotype. These target sequences are
CC identified by the ribozyme of the invention. The ribozymes is formed in a
CC hammerhead motif, but may also be formed in the motif of a hairpin,
CC hepatitis delta virus, group I intron or RNaseP-like RNA. These ribozymes
CC may be used to inhibit the development or expression of a transformed
CC phenotype in man and other animals by modulating expression of the
CC corresponding gene. Cleavage of target mRNAs expressed in pre-neoplastic
CC and transformed cells elicits inhibition of the transformed state.
CC Multiple drug resistance (mdr-1) mRNA specific ribozymes remove the
CC mechanism of drug resistance used by transformed cells and thus enhances
CC drug therapies for tumours. The ribozymes may also be used to study
CC genetic drift and mutations within cells. (Updated on 25-MAR-2003 to
CC correct PN field.)

XX DT
XX DT Identifying new catalytic nucleic acid that modulates selected processes
XX PT - especially ribozymes that cleave Raf RNA for treating cancer,
XX PT restenosis, and also new ribozymes and modified nucleoside triphosphates
XX PT used as antiviral agents and synthons.
XX PS Claim 177; Page 172; 259pp; English.
XX CC A method has been developed for the identification of a nucleic acid
XX CC capable of modulating a process in a biological system. The method
XX CC comprises: (a) introducing into the system a random library of nucleic
XX CC acid catalysts (NAC) having a substrate binding domain (SBD), comprising
XX CC a random sequence, and a catalytic domain (CD); and (b) identifying NAC
XX CC in systems where modulation has occurred and/or determining the sequence
XX CC of at least part of the SBDs in such systems. Nucleic acid molecules with
XX CC endonuclease activity and catalytic activity, from the present invention,
XX CC are used to modulate gene expression in plant and mammalian cells and to
XX CC cleave target nucleic acid, particularly for treating systemic diseases
XX CC caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepatic
XX CC ascites and infection. They may also be used to detect genetic drift and
XX CC mutations in diseased cells and to determine c-raf RNA. Specifically NACs
XX CC with RNA-cleaving activity that modulate expression of the Raf gene, are
XX CC used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or
XX CC generally any condition associated with the level of c-raf. Introduction
XX CC of sugar/phosphate modifications increases stability against nuclease and
XX CC activity. AAV90922 to AAV93877 represent NACs that can be used in the
XX CC method, specifically for modulating the expression of a Raf gene

XX
CC      The present sequence represents a potential triple-helix forming region.
CC      It can be used to demonstrate the assay of the invention. The assay
CC      comprises adding a sample containing double-stranded DNA test sequences,
CC      e.g. containing the present sequence, to an aqueous medium containing at
CC      least one complex of anchor DNA, attached to a solid support, and
CC      reporter DNA, where either a part of the anchor DNA or reporter DNA is
CC      designed to form a triple-strand structure with part of the test
CC      sequence. Triplex formation results in displacement of the reporter DNA
CC      which is detected as an indication of the presence of the DNA test
CC      sequence. The method is used to detect DNA sequences, particularly for
CC      identification of bacteria (by detecting genes for ribosomal RNA) in
CC      clinical samples, but also detection of oncogenes and Hepatitis B virus

 PT Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense  
 PT constructs, which down regulate expression of a CD20 gene or neurite  
 PT growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and  
 PT central nervous system injury.  
 PS  
 XX Claim 88; Page 69; 200pp; English.  
 XX  
 CC The invention relates to a nucleic acid molecule which down regulates  
 CC expression of a CD20 gene and a nucleic acid molecule which down  
 CC regulates expression of a neurite growth inhibitor gene (NOGO). The  
 CC nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a  
 CC DNzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA motif) or  
 CC possessing an NCH motif), a G-cleaver (cleaving RNA with an NYN motif) or  
 CC an amberyzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA  
 CC with a YGY motif). The CD20-targeting nucleic acid is used to cleave RNA  
 CC of CD20 in the presence of a divalent cation that is preferably Mg<sup>2+</sup>.  
 CC Furthermore, it may be contacted with a cell to reduce CD20 activity of  
 CC the cell and treat a patient having a condition associated with the level  
 CC of CD20. The treatment may further comprise the use of one or more  
 CC therapies. In particular, the CD20 targeting nucleic acid may be used to  
 CC treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-  
 CC Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic  
 CC leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell  
 CC lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma,  
 CC immune thrombocytopenia, and inflammatory arthropathy. The NOGO-  
 CC targeting nucleic acid is used to cleave RNA of the NOGO gene in the  
 CC presence of a divalent cation that is preferably Mg<sup>2+</sup>. Furthermore, the  
 CC nucleic acid may be contacted with a cell to reduce NOGO activity of the

CC cell and treat a patient having a condition associated with the level of  
 CC NOGO. The treatment may further comprise the use of one or more  
 CC therapies. In particular, the NOGO-targeting nucleic acid may be used to  
 CC treat central nervous system (CNS) injury and cerebrovascular accident  
 CC (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS),  
 CC chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS),  
 CC Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob  
 CC disease, muscular dystrophy, and/or other neurodegenerative disease  
 CC states which respond to the modulation of NOGO expression. The present  
 CC sequence is a hammerhead ribozyme of the invention

 PT New IKBKAP genes with mutations, useful for identifying a subject with  
 PT familial dysautonomia (FD), or for rapid carrier screening in the  
 PT Ashkenazi Jewish population, e.g. screening presymptomatic homozygotes or  
 PT prenatal diagnosis.  
 XX  
 PS Disclosure; Fig 11; 109pp; English.  
 XX  
 CC The present invention relates to methods and compositions useful for  
 CC detecting mutations which cause Familial Dysautonomia (FD, Riley-Day  
 CC syndrome, Hereditary Sensory and Autonomic Neuropathy Type III) (OMIM  
 CC 223900). It was found that mutations in the IKBKAP gene (see ABQ80565)  
 CC are associated with FD. The mutation associated with the major haplotype  
 CC of FD, FD1 mutation, is a base pair (bp) mutation, where the thymine  
 CC nucleotide located at bp 6 of intron 20 in the IKBKAP gene is replaced  
 CC with a cytosine. This results in skipping of exon 20 in the mRNA from FD  
 CC patients, although they continue to express varying levels of wild-type  
 CC message in a tissue-specific manner. The mutation associated with the  
 CC minor haplotype, FD2 mutation, is a bp mutation, where the guanine  
 CC nucleotide at bp 2397 (bp 73 of exon 19) is replaced with a cytosine.  
 CC This bp mutation causes an arginine to proline missense mutation (R896P)  
 CC in the IKBKAP protein, which is predicted to disrupt a potential  
 CC phosphorylation site. The IKBKAP nucleic acid sequences are useful for

CC identifying a subject with FD and for rapid carrier screening. The IKBKAP  
 CC gene maps to chromosome 9q31. A mouse model of FD was created in an  
 CC example from the invention. Expression of murine Ikbkap was examined  
 CC using both mouse embryo and adult mouse multiple tissue Northern blots.  
 CC The blots were probed with a 1045bp PCR fragment that contains exons 2  
 CC through 11, which was generated using PCR primers ABQ80563-ABQ80564.  
 CC ABQ99662-ABQ99733 are the murine Ikbkap exon and intron boundaries

 PT New isolated nucleic acid, useful for treating viral diseases associated  
 PT with tumors and cell degeneration, also related polypeptides, antibodies  
 PT and transfected cells.  
 XX  
 PS Disclosure; Page 601; 720pp; French.  
 XX  
 CC The invention relates to a novel isolated 17 mer nucleic acid sequence,  
 CC given in the specification, a sequence containing at least 15 consecutive  
 CC nucleotides from the 17 mer sequence, a sequence with, after optimal  
 CC alignment, at least 80 % identity to the 17 mer sequence, a sequence that  
 CC hybridizes to them under highly stringent conditions, or the complement  
 CC of any of them, or the corresponding RNA. The novel isolated nucleic  
 CC acids of the invention are useful as probes and primers for detecting,  
 CC identifying, quantifying and/or amplifying a nucleic acid, e.g. as one  
 CC component of a gene chip, in vitro as (anti)sense reagents, and for  
 CC production of recombinant polypeptides. Any of the nucleic acids,  
 CC polypeptides, vectors containing the nucleic acids, cells containing the  
 CC vector or antibodies directed against the polypeptides are useful for  
 CC preparation of pharmaceuticals for prevention and/or treatment of viral  
 CC diseases that are characterised by development of tumours or cell  
 CC degeneration, specifically cancer but also Alzheimer's disease and  
 CC schizophrenia. Analysis of the expression of the 17 mer nucleic acids in  
 CC patient samples is useful for diagnosis and/or prognosis of these

CC diseases. The polypeptides can also be used to generate antibodies, and  
CC both the polypeptide and antibodies are useful as components of protein  
CC chips. The nucleic acid sequences of the invention can be used in gene  
CC therapy. This polynucleotide sequence represents a tumour suppression  
CC related human fukutin oligonucleotide of the invention

XX Novel short interfering RNA and enzymatic nucleic acid useful for  
PT treating cancer, modulates the expression of a nucleic acid encoding  
PT HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.  
XX  
PS Claim 58; Page 85; 185pp; English.  
XX  
XX The invention relates to a novel short interfering RNA (siRNA) nucleic  
CC acid molecule or an enzymatic nucleic acid molecule, that modulates  
CC expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras,  
CC human immunodeficiency virus (HIV) or a component of HIV. The nucleic  
CC acid molecule of the invention has cytosolic, anti-HIV, and anti-  
CC rheumatic activity. The nucleic acid molecules are useful for reducing  
CC HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are  
CC also useful for treating breast, ovarian, colorectal, lung, prostate,  
CC bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences  
CC shown in ABZ59889 - ABZ62216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66524,

XX  
XX The present invention relates to murine oligonucleotides (ACC62754-  
CC ACC6806), which are associated with tumour suppression, tumour  
CC reversion, apoptosis and virus resistance. The oligonucleotides are  
CC useful as (1) as probes and primers for detecting, identifying,  
CC quantifying and/or amplifying nucleic acid, e.g. as one component of a  
CC gene chip; in vitro as (anti)sense reagents; and (2) for production of a  
CC recombinant polypeptides. The oligonucleotides are useful for preparation  
CC of pharmaceuticals for prevention and/or treatment of viral diseases that  
CC are characterised by development of tumours or cell degeneration,  
CC specifically cancer but also Alzheimer's disease and schizophrenia

XX New nucleic acid encoding human prostate membrane-specific antigen,  
 PT useful e.g. for treatment of tumors and viral infection, also related  
 PT polypeptide and antibodies.

XX Disclosure; Page 173; 771pp; French.

XX The invention relates to the isolation of 6327 nucleotide sequences,  
 CC fragments of at least 15 consecutive nucleotides of these nucleotides, a  
 CC sequence having at least 80% identity, after optimal alignment, with the  
 CC nucleotides, a sequence that hybridizes under stringent conditions with  
 CC the nucleotides, or the complement, or corresponding RNA, of the  
 CC nucleotides. The nucleotides are used as probes or primers for detecting,  
 CC identifying, quantifying and/or amplifying nucleic acids, as in vitro  
 CC sense and antisense sequences, of nucleotides involved in tumour  
 CC suppression or reversion, apoptosis and or viral resistance, to produce  
 CC recombinant polypeptides, and to prepare transgenic animals, as  
 CC experimental models. The nucleotides (also vectors containing them and  
 CC cells containing the vectors), the encoded polypeptides and antibodies  
 CC (Ab) against the polypeptide are useful for prevention and/or treatment

CC of viral infections or diseases characterized by development of tumours

XX Polynucleotides differentially regulated in response to cholesterol and  
 PT adipogenesis are useful to detect and treat associated conditions such as  
 PT obesity, atherosclerosis, diabetes mellitus and coronary artery heart  
 PT disease.

XX Claim 8; SEQ ID NO 439; 59pp; English.

XX The invention describes a composition comprising at least one expression  
 CC vector comprising a polynucleotide of the invention. The composition has  
 CC anorectic, antiarteriosclerotic, cardiant and antidiabetic properties.  
 CC The invention is used to detect and treat conditions associated with  
 CC elevated cholesterol and lipid or during adipogenesis, particularly  
 CC obesity, atherosclerosis, diabetes mellitus or coronary artery heart  
 CC disease. This sequence represents a polynucleotide differentially  
 CC expressed during cholesterol homeostasis and adipogenesis.

XX
New molecular marker for a gene determining fructose:glucose ratio in
mature tomatoes - useful for finding this gene and producing tomato
seeds, plants and/or fruit with an increased fructose to glucose ratio.
Claim 2; Page 11; 17pp; English.
XX
The present invention describes a molecular marker for a gene determining
fructose:glucose ratio in mature tomatoes. Also described are: (1)
breeding tomato plants that produce tomatoes having superior taste
characteristics. At least one Lycopersicon esculentum plant is crossed
with a Lycopersicon spp. to produce hybrid (F1) seeds, which grow into F1
plants that produce seeds. These seeds produce plants, which produce ripe
fruit, in which the fructose:glucose content is determined using the
marker gene; and (2) tomato plants produced by the method, and their
fruit and seeds. The marker is useful for finding (and cloning) genes
that produce tomatoes having superior taste characteristics. The marker
gene is also useful in a method of breeding tomato plants for selecting
plants producing fruit having desired characteristics, including a higher
fructose:glucose ratio than that of standard L. esculentum. The molecular
marker enables the selection of tomato plants at the young seedling
stage, and eliminates undesirable environmental effects on the plant
phenotype, which can limit the effectiveness of selection for a phenotype
characteristic. The present sequence represents a primer used in
producing an amplification product for use as the marker

PA (BIOC-) BIOCRYSTAL LTD.  
XX Barbra-Guillem E, Nelson MB, Castro S;  
XX WPI; 2000-376593/32.  
XX Functionalized nanocrystal carrying polynucleotide, used for detecting  
PT target analyte, forms dendrimers with complementary nanocrystals to  
PT amplify the fluorescent signal.  
XX Example 3; Page 69; 72pp; English.  
XX The present invention relates to functionalised nanocrystals for use in  
CC nonisotopic detection systems for biomolecules e.g. nucleic acids,  
CC proteins, lipids or drugs. The nanocrystals have polynucleotide strands  
CC attached to their surfaces with one end of the polynucleotide extending  
CC outwardly from the nanocrystal. The present sequence is one such of  
CC polynucleotide. These nanocrystals are used with a second series of  
CC nanocrystals, which have polynucleotides complementary to the first  
CC polynucleotides, so that the respective complementary strands hybridise  
CC to each other and form a dendrimer. This dendrimer produces a signal  
CC which can then be detected e.g. fluorescence. The present sequence is  
CC composed mainly of Thymine bases. This sequence may therefore be used  
CC with a polynucleotide composed mainly of Adenine bases (AAA58385)

XX  
XX Determining the concentration of a target nucleic acid, useful e.g. for  
PT detecting genetic mutations, comprises using a fluorescently labeled  
PT probe in which emission is reduced by binding to the target nucleic acid.  
XX Example 5; Page 21; 55pp; English.  
PS

XX The invention relates to the determination of the concentration of a  
CC nucleic acid target, using a fluorescently labeled probe which produces  
CC reduced fluorescence emission when hybridised to the target nucleic acid.  
CC The method comprises measuring the reduction in emission caused by  
CC hybridisation. The new method is particularly used to quantify target  
CC nucleic acids by a real-time polymerase chain reaction, e.g. for  
CC quantifying microbial cells in co-cultures or symbiotic systems, for  
CC detecting gene mutations or polymorphisms, and for analysing melting  
CC curves of target nucleic acids to determine a Tm value. Methods of the  
CC invention allow target nucleic acids to be quantified quickly, easily and  
CC accurately. Particularly there is no need to remove unbound probe, and no  
CC materials are introduced that inhibit amplification by Taq polymerase (so  
CC conventional PCR conditions can be used). The specificity of PCR is kept  
CC high (amplification of primer dimers is delayed), and the limit of  
CC quantitation is reduced. Complex probes are not needed, and amplification  
CC can be monitored in real time. The working graph for data analysis  
CC (automatically generated by a computer) has a higher correlation  
CC coefficient than conventional graphs so more accurate quantitation is

XX Determining the concentration of a target nucleic acid, useful e.g. for  
PT detecting genetic mutations, comprises using a fluorescently labeled  
PT probe in which emission is reduced by binding to the target nucleic acid.  
XX Example 5; Page 21; 55pp; English.  
XX  
XX The invention relates to the determination of the concentration of a

CC nucleic acid target, using a fluorescently labeled probe which produces  
 CC reduced fluorescence emission when hybridised to the target nucleic acid.  
 CC The method comprises measuring the reduction in emission caused by  
 CC hybridisation. The new method is particularly used to quantify target  
 CC nucleic acids by a real-time polymerase chain reaction, e.g. for  
 CC quantifying microbial cells in co-cultures or symbiotic systems, for  
 CC detecting gene mutations or polymorphisms, and for analysing melting  
 CC curves of target nucleic acids to determine a Tm value. Methods of the  
 CC invention allow target nucleic acids to be quantified quickly, easily and  
 CC accurately. Particularly there is no need to remove unbound probe, and no  
 CC materials are introduced that inhibit amplification by Taq polymerase (so  
 CC conventional PCR conditions can be used). The specificity of PCR is kept  
 CC high (amplification of primer dimers is delayed), and the limit of  
 CC quantitation is reduced. Complex probes are not needed, and amplification  
 CC can be monitored in real time. The working graph for data analysis  
 CC (automatically generated by a computer) has a higher correlation  
 CC coefficient than conventional graphs so more accurate quantitation is  
 CC possible. The current sequence represents a nucleic acid probe of the  
 CC invention that was used for investigating the base selectivity of a  
 CC target nucleic acid

XX Detecting and differentiating between hematopoietic cell proliferative  
XX disorders, comprises contacting a target nucleic acid with a reagent that  
XX distinguishes between methylated and non-methylated CpG dinucleotides.  
XX  
XX Claim 15; Page 47; 117pp; English.

XX The present invention describes a method for detecting and  
XX differentiating between haematopoietic cell proliferative disorders  
XX associated with at least 1 gene and/or their regulatory regions in a  
XX subject. The method comprises contacting a target nucleic acid in a  
XX biological sample obtained from the subject with at least 1 reagent,  
XX which distinguishes between methylated and non-methylated CpG  
XX dinucleotides within the target nucleic acid. ABZ09861 to ABZ11118  
XX represent specifically claimed nucleotide sequences from the present  
XX invention. Oligonucleotides from the present invention can be used: for  
XX differentiating between healthy haematopoietic cells and proliferative  
XX disorder haematopoietic cells; for differentiating between acute  
XX lymphocytic leukaemia and acute myelogenous leukaemia; as probes for  
XX determining the cytosine methylation state and/or single nucleotide  
XX polymorphisms (SNPs) of haematopoietic cell proliferation disorder  
XX related sequences and their complements; and as primers for the  
XX amplification of haematopoietic cell proliferation disorder related DNA  
XX sequences. The nucleotide sequences from the present invention can also  
XX be used for detecting a predisposition to, differentiation between  
XX subclasses, diagnosis, prognosis, treatment and/or monitoring of  
XX haematopoietic cell proliferative disorders. The present method enables a  
XX highly specific classification of haematopoietic cell proliferative  
XX disorders allowing for improved and informed treatment of patients

XX Claim 36; Page 30; 74pp; English.

XX The invention relates to a novel method for detecting and differentiating  
XX between colon cell proliferative disorders associated with at least one  
XX gene or its regulatory regions. The method comprises contacting a target  
XX nucleic acid in a biological sample obtained from the subject with at  
XX least one reagent or a series of reagents, where the reagent or series of  
XX reagents, distinguishes between methylated and non methylated CpG  
XX dinucleotides within the target nucleic acid. The molecules of the  
XX invention demonstrate cytostatic activity whilst the method may useful  
XX for detecting and differentiating between colon cell proliferative  
XX disorders, including cancers such as colon adenoma and colon carcinoma.  
XX The FNA (peptide nucleic acid)-oligomers are useful as probes for  
XX determining cytosine methylation state or single nucleotide  
XX polymorphisms. The current sequence is that of the hybridisation  
XX oligonucleotide of the invention which was used to analyse the genomic  
XX DNA region.

 XX CC This invention relates to a novel method for detecting and  
 CC differentiating between lung cell proliferative disorders associated with  
 CC at least one gene and/or their regulatory regions. Specifically, it  
 CC refers to a method comprising contacting a target nucleic acid in a  
 CC biological sample with at least one reagent, wherein the reagent is able  
 CC to distinguish between methylated and non-methylated CpG dinucleotides  
 CC present in the target DNA. As such, it is possible to further  
 CC differentiate and diagnose medical conditions including adenocarcinoma  
 CC and squamous cell carcinoma and their respective adjacent lung tissue.  
 CC The present invention describes cytosinatic oligomers and PNA-oligomers  
 CC that are useful as probes for determining the cytosine methylation state  
 CC or single nucleotide polymorphisms (SNPs) of the target sequence. This  
 CC oligonucleotide sequence is a primer oligomer used for the analysis of  
 CC CpG positions within genomic DNA, used in an exemplification of the  
 CC invention.

New voltage-gated chloride channel CIC-2 polynucleotides and  
polypeptides, useful in diagnosing and treating a neurological disease or  
disorder such as idiopathic generalized epilepsy.  
Claim 19; SEQ ID NO 18; 124pp; English.  
The present invention describes a nucleic acid molecule (I) comprising a  
sequence encoding a polypeptide which has an amino acid sequence of a  
voltage-gated chloride channel CIC-2, where the glycine (Gly) residue  
corresponding to position 715 of the wild-type voltage-gated chloride  
channel CIC-2 comprising a 898 amino acid sequence of SEQ ID NO:2, is  
replaced by another amino acid residue. The voltage-gated chloride  
channel CIC-2 is encoded by the CLCN2 gene. The human CLCN2 gene is  
located on chromosome 3, more specifically to 3q26. Also described: (1) a  
vector comprising (1); (2) a host transformed with the vector of (1) or  
transformed with (1); (3) a method of producing the polypeptide encoded  
by (1); (4) a polypeptide encoded by (1) produced by the method of (3);  
(5) an antibody specifically directed to the polypeptide of (4), where  
the antibody specifically reacts with an epitope generated and/or formed  
apart from specifically binding to (1) or to the polypeptide of (4); (7) a  
primer or pair of primers capable of specifically amplifying (1); (8) a  
composition comprising (1), the vector of (1), the polypeptide of (4),  
the antibody of (5), the aptamer of (6) and the primer or pair of primers  
of (7); (9) a method of diagnosing a neurological disease or a  
susceptibility to a neurological disease; (10) a pharmaceutical  
composition comprising (1); (11) a method of treating a neurological  
disease; (12) a kit comprising (1) the vector of (1), the host of (2),  
the polypeptide of (4), the antibody of (5), the aptamer of (6) and the  
primer or pair of primers of (7); (13) a method of identifying or  
screening for molecules capable of specifically interacting with the  
polypeptide of (4); (14) a method of characterising molecules capable of  
altering the characteristic of the polypeptide of (4); and (15) a method  
of producing a pharmaceutical composition. (1) has neuroprotective and  
anticonvulsant activities. The nucleic acid molecule, vector,  
polypeptide, antibody, aptamer and the primer or pair of primers from the  
present invention can be used in preparing a diagnostic or pharmaceutical  
composition for the detection and treatment of a neurological disease or  
disorder, i.e. idiopathic generalised epilepsy (IGE), e.g. childhood  
absence epilepsy (CAE), juvenile absence epilepsy (JAE), juvenile  
myoclonic epilepsy (JME) or epilepsy with grand mal seizures on awakening  
(EGMA). The present sequence represents a PCR primer for the human CLCN-2

CC gene, which is given in the exemplification of the present invention.

PT Identifying a subject at risk of breast cancer by detecting the presence  
of polymorphic variations in the DLG1, KIAA0783, DPf3 or CENPC1 regions  
which are associated with breast cancer in a nucleic acid sample from a  
subject.  
XX  
XX Example 4; Page 78; 227pp; English.  
XX  
CC The present invention relates to a method for identifying a subject at  
risk of breast cancer. The method comprising detecting the presence or  
absence of one or more polymorphic variations associated with breast  
cancer in a nucleic acid sample from a subject. The nucleic acid sample  
comprises the DLG1 region (ADO79402), KIAA0783 region (ADO79403), DPf3  
region (ADO79404) or CENPC1 region (ADO79405). The gene DLG1 (discs,  
large homolog 1 (Drosophila)) is also known as synapse-associated protein  
97, hdlg or SAP97. DLG1 has been mapped to chromosomal position 3q29. The  
gene KIAA0783 is also known as PHF14 and PHD finger protein 14. KIAA0783  
has been mapped to chromosomal position 7p21.3. The KIAA0783 protein is a  
novel gene with unknown function, however, being a zinc finger protein,  
it likely to be a transcription factor. The gene DPf3 (D4, zinc and  
double PHD fingers, family 3) is also known as CERD4, cer-d4, FLJ14079  
and 2810403H03R1K. DPf3 is a Rho family guanine-nucleotide exchange  
factor. DPf3 has been mapped to chromosomal position 14q24.3-q31.1. The  
gene CENPC1 (centromere protein C1) is also known as Centromere  
autoantigen C1. CENPC1 has been mapped to chromosomal position 4q12-  
q13.3. CENPC1 is a centromere autoantigen and a component of the inner  
kinetochore plate. The CENPC1 protein is required for maintaining proper  
kinetochore size and a timely transition to anaphase. The method is  
useful for identifying a subject at risk of breast cancer, for early

CC diagnosis, prevention and treatment of breast cancer, to analyze and  
 CC predict a response to a breast cancer treatment, and in clinical drug  
 CC trials. The present sequence was used in an example from the invention.

 PT Predicting responsiveness of a subject with breast cell proliferative  
 PT disorder, useful for treating or differentiating breast cell  
 PT proliferative disorders comprises analyzing methylation pattern of a  
 PT genomic DNA from the subject.  
 XX  
 PS Disclosure; SEQ ID NO 1078; 104pp; English.  
 XX  
 CC The invention relates to a novel method for predicting the responsiveness  
 CC of a subject with a cell proliferative disorder of the breast tissues to  
 CC a therapy comprising analysing the methylation pattern of a target  
 CC nucleic acid by contacting at least one of the target nucleic acids in a  
 CC biological sample obtained from the subject prior to or during treatment.  
 CC The method of the invention has cytostatic activity, and may have a use  
 CC in gene therapy. The set of oligonucleotides comprising at least two of  
 CC the oligomers are useful for detecting the cytosine methylation state  
 CC and/or single nucleotide polymorphisms (SNPs) within the sequences. The  
 CC methods, nucleic acid, oligonucleotide, and kit are useful for the  
 CC treatment, characterisation, classification and/or differentiation, of  
 CC breast cell proliferative disorders. The method is also useful for  
 CC predicting the responsiveness of a subject with a cell proliferative  
 CC disorder of the breast tissues to a therapy. The present sequence is used  
 CC in the exemplification of the invention.

XX  
XX Interference RNA agent useful for treating dyslipidemias, coronary artery  
XX disease, diabetes, cancer or neurological disease, comprises sense  
XX sequence and antisense sequence which has specific modifications.  
XX  
XX Example 5; SEQ ID NO 3019; 378pp; English.  
XX  
XX The invention describes a RNA interference (iRNA) agent (I) comprising a  
XX sense sequence and an antisense sequence, where the sense sequences have  
XX one or more asymmetrical 2'-O alkyl modifications, the antisense  
XX sequences have one or more asymmetrical phosphorothioate modifications  
XX and the antisense sequence targets a human gene sequence. Also described  
XX are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100  
XX levels or glucose-6-phosphatase levels in a subject; producing (I);  
XX stabilising (I), involves selecting a sequence with activity and  
XX introducing one or more asymmetrical modification in the sequence, where  
XX the modification decreases nuclease sensitivity while not decreasing its  
XX activity; a kit comprising (I) and instruction for its use; and a device  
XX that can be dispense or administer a composition comprising (I). (I) is  
XX useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1)  
XX is useful for reducing apoB-100 levels or glucose-6-phosphatase levels.  
XX The subject is suffering from a disorder characterised by elevated or  
XX otherwise unwanted expression of apoB-100, elevated or otherwise unwanted  
XX levels of cholesterol, and/or dysregulation of lipid metabolism. The  
XX disorder is chosen from the HDL/LDL cholesterol imbalance,  
XX dyslipidaemias, hypercholesterolaemia, statin-resistant  
XX hypercholesterolaemia, coronary artery disease (CAD), coronary heart

CC disease (CHD) and atherosclerosis. (I) is administered to a subject to  
CC inhibit hepatic glucose production or for treating glucose-metabolism-  
CC related disorder e.g. diabetes or type-2 diabetes. (I) is useful for  
CC treating the diseases as mentioned above, cancer (e.g. breast, colon or  
CC lung cancer), neurological disease (e.g., Huntington disease or  
CC spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence  
CC represents a human apolipoprotein B (ApoB) antisense oligonucleotide that  
CC can be used to control ApoB gene expression.

 XX  
 XX Pharmaceutical composition for treating asthma, has antisense  
 PT oligonucleotide containing less percentage of adenosine, targeted to  
 PT nucleic acids associated with lung airway or lung dysfunction, and  
 PT bronchodilating agent.  
 XX  
 XX Claim 15; SEQ ID NO 4055; 763pp; English.  
 XX  
 XX This invention describes a novel composition (a) a first active agent,  
 CC comprising oligonucleotides, effective for alleviating  
 CC bronchoconstriction, respiratory tract inflammation, allergies and  
 CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,  
 CC surfactant depletion or hyposecretion, when administered to a mammal. The  
 CC oligonucleotides are derived from a gene encoding or regulating  
 CC expression of a target polypeptide associated with lung airway or lung  
 CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.  
 CC The invention also describes a kit, that comprises: (a) a delivery  
 CC device, in separate containers, (b) the oligonucleotides, (c)

CC instructions for adding a carrier and for use of the kit. The composition  
 CC of the invention has anti-allergic, anti-inflammatory, antiasthmatic,  
 CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a  
 CC beta-adrenergic agonist. The composition is useful for preventing or  
 CC treating a respiratory, lung or malignant disease. The administered  
 CC composition comprises oligo and is administered to reduce the production  
 CC or availability, or to increase the degradation of the target mRNA or to  
 CC reduce the amount of target polypeptide present in the lungs. The  
 CC pulmonary obstruction, and/or bronchoconstriction and/or lung  
 CC inflammation, allergies and/or surfactant hypoproduction are associated  
 CC with a disease or condition such as pulmonary vasoconstriction,  
 CC inflammation, allergies, asthma, impeded respiration, respiratory  
 CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary  
 CC hypertension, emphysema, chronic obstructive pulmonary disease, cancer.  
 CC transplantation rejection, pulmonary infections, bronchitis or cancer.  
 CC The reduced adenosine content of the anti-sense oligos corresponding to  
 CC thymidines present in the target RNA serves to prevent the breakdown of  
 CC the oligonucleotides into products that free adenosine into the system  
 CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to  
 CC prevent any unwanted effects due to it

 XX New IKBKAP genes with mutations, useful for identifying a subject with  
 PT familial dysautonomia (FD), or for rapid carrier screening in the  
 PT Ashkenazi Jewish population, e.g. screening presymptomatic homozygotes or  
 PT prenatal diagnosis.  
 XX  
 XX Disclosure; Fig 11; 109pp; English.  
 XX  
 XX The present invention relates to methods and compositions useful for  
 CC detecting mutations which cause Familial Dysautonomia (FD, Riley-Day  
 CC syndrome, Hereditary Sensory and Autonomic Neuropathy Type III) (OMIM  
 CC 223900). It was found that mutations in the IKBKAP gene (see ABQ05055)  
 CC are associated with FD. The mutation associated with the major haplotype

CC of FD, FD1 mutation, is a base pair (bp) mutation, where the thymine  
 CC nucleotide located at bp 6 of intron 20 in the IKBKAP gene is replaced  
 CC with a cytosine. This results in skipping of exon 20 in the mRNA from FD  
 CC patients, although they continue to express varying levels of wild-type  
 CC message in a tissue-specific manner. The mutation associated with the  
 CC minor haplotype, FD2 mutation, is a bp mutation, where the guanine  
 CC nucleotide at bp 2397 (bp 73 of exon 19) is replaced with a cytosine.  
 CC This bp mutation causes an arginine to proline missense mutation (R696P)  
 CC in the IKBKAP protein, which is predicted to disrupt a potential  
 CC phosphorylation site. The IKBKAP nucleic acid sequences are useful for  
 CC identifying a subject with FD and for rapid carrier screening. The IKBKAP  
 CC gene maps to chromosome 9q31. A mouse model of FD was created in an  
 CC example from the invention. Expression of murine Ikbkap was examined  
 CC using both mouse embryo and adult mouse multiple tissue Northern blots.  
 CC The blots were probed with a 1045bp PCR fragment that contains exons 2  
 CC through 11, which was generated using PCR primers ABQ80563-ABQ80564.  
 CC ABQ99662-ABQ99733 are the murine Ikbkap exon and intron boundaries

 PT useful e.g. for treatment of tumors and viral infection, also related  
 PT polypeptide and antibodies.  
 XX Disclosure; Page 173; 771pp; French.  
 XX The invention relates to the isolation of 6327 nucleotide sequences,  
 CC fragments of at least 15 consecutive nucleotides of these nucleotides, a  
 CC sequence having at least 80% identity, after optimal alignment, with the  
 CC nucleotides, a sequence that hybridizes under stringent conditions with  
 CC the nucleotides, or the complement, or corresponding RNA, of the  
 CC nucleotides. The nucleotides are used as probes or primers for detecting,

CC identifying, quantifying and/or amplifying nucleic acids, as in vitro  
 CC sense and antisense sequences, of nucleotides involved in tumour  
 CC suppression or reversion, apoptosis and or viral resistance, to produce  
 CC recombinant polypeptides, and to prepare transgenic animals, as  
 CC experimental models. The nucleotides (also vectors containing them and  
 CC cells containing the vectors), the encoded polypeptides and antibodies  
 CC (Ab) against the polypeptide are useful for prevention and/or treatment  
 CC of viral infections or diseases characterized by development of tumours  
 CC or cell degeneration (e.g. Alzheimer's disease or schizophrenia).  
 CC Analysis of the expression of the nucleotides can be used for diagnosis  
 CC and/or prognosis of these diseases. The nucleotides and polypeptides can  
 CC also be used to screen for their specific interactive molecules,  
 CC potentially useful for treating diseases associated with abnormal  
 CC expression of the nucleotides.

XX This sequence represents a primer of the invention. The invention relates to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta-N3'; or (X)m5'-(gamma)k-delta-N3'; where X = a labelled compound and/or a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, guanine or cytosine; N = adenine, guanine, cytosine or thymine; gamma = thymine; k = natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene sequences

XX Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.  
XX  
XX Claim 59; SEQ ID NO 2942; 317pp; English.  
XX  
XX The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR), IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the expression of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a target RNA in a cell. The present RNA sequence represents a human PKR substrate sequence.

XX  
 CC The invention relates to a class of CpG immunostimulatory  
 CC oligonucleotides containing a 5'TCG motif or a CG at or the 5' end that  
 CC are useful for stimulating an immune response. Oligonucleotides and  
 CC compositions of the invention are useful for treating allergy or asthma,  
 CC viral and bacterial infections and cancer e.g. biliary tract cancer,  
 CC breast cancer, cervical cancer, choriocarcinoma, colon cancer,  
 CC endometrial cancer, gastric cancer, lymphomas, intraepithelial neoplasms,  
 CC liver cancer, lung cancer (e.g. small cell and non-small cell), melanoma,  
 CC neuroblastomas, ovarian cancer, pancreatic cancer, prostate cancer,  
 CC rectal cancer, sarcomas, thyroid cancer, renal cancer, bone cancer, brain  
 CC and CNS cancer, connective tissue cancer, oesophageal cancer, eye cancer,  
 CC Hodgkin's lymphoma, larynx cancer, oral cavity cancer, skin cancer,  
 CC testicular cancer, as well as other carcinomas and sarcomas. The  
 CC invention is also useful in gene therapy. The present sequence is a CpG  
 CC immunostimulatory oligonucleotide.
